Computer Processing of Remotely-Sensed Images Paul M. Mather, Magaly Koch, 2022-04-06 Computer Processing of Remotely Sensed Images A thorough introduction to computer processing of remotely sensed images processing methods and applications Remote sensing is a crucial form of measurement that allows for the gauging of an object or space without direct physical contact allowing for the assessment and recording of a target under conditions which would normally render access difficult or impossible This is done through the analysis and interpretation of electromagnetic radiation EMR that is reflected or emitted by an object surveyed and recorded by an observer or instrument that is not in contact with the target This methodology is particularly of importance in Earth observation by remote sensing wherein airborne or satellite borne

instruments of EMR provide data on the planet's land, seas, ice and atmosphere. This permits scientists to establish relationships between the measurements and the nature and distribution of phenomena on the Earth's surface or within the atmosphere. Still relying on a visual and conceptual approach to the material, the fifth edition of this successful textbook provides students with methods of computer processing of remotely sensed data and introduces them to environmental applications which make use of remotely sensed images. The new edition's content has been rearranged to be more clearly focused on image processing methods and applications in remote sensing with new examples including material on the Copernicus missions, microsatellites and recently launched SAR satellites as well as time series analysis methods. The fifth edition of *Computer Processing of Remotely Sensed Images* also contains a cohesive presentation of the fundamental components of Earth observation remote sensing that is easy to understand and highly digestible. Largely non-technical language providing insights into more advanced topics that may be too difficult for a non-mathematician to understand. Illustrations and example boxes throughout the book to illustrate concepts as well as revised examples that reflect the latest information. References and links to the most up-to-date online and open access sources used by students. *Computer Processing of Remotely Sensed Images* is a highly insightful textbook for advanced undergraduates and postgraduate students taking courses in remote sensing and GIS in Geography, Geology and Earth Environmental Science departments.

*Introduction to Remote Sensing of the Environment* Benjamin F. Richason, 1978      **Eye in the Sky** Dorothy Harper, 1983

*Introduction to Environmental Remote Sensing* Eric C. Barrett, Leonard F. Curtis, 2013-05-13 Taking a detailed non-mathematical approach to the principles on which remote sensing is based, this book progresses from the physical principles to the application of remote sensing.      *Introduction to the Physics and Techniques of Remote Sensing* Charles Elachi, Jakob J. van Zyl, 2006-05-11 The science and engineering of remote sensing theory and applications. The Second Edition of this authoritative book offers readers the essential science and engineering foundation needed to understand remote sensing and apply it in real world situations. Thoroughly updated to reflect the tremendous technological leaps made since the publication of the first edition, this book covers the gamut of knowledge and skills needed to work in this dynamic field including Physics involved in wave-matter interaction, the building blocks for interpreting data, Techniques used to collect data, Remote sensing applications. The authors have carefully structured and organized the book to introduce readers to the basics and then move on to more advanced applications. Following an introduction, Chapter 2 sets forth the basic properties of electromagnetic waves and their interactions with matter. Chapters 3 through 7 cover the use of remote sensing in solid surface studies including oceans. Each chapter covers one major part of the electromagnetic spectrum: e.g. visible, near-infrared, thermal infrared, passive microwave and active microwave. Chapters 8 through 12 then cover remote sensing in the study of atmospheres and ionospheres. Each chapter first presents the basic interaction mechanism followed by techniques to acquire, measure and study the information or waves emanating from the medium under investigation. In most cases, a specific

advanced sensor is used for illustration The book is generously illustrated with fifty percent new figures Numerous illustrations are reproduced in a separate section of color plates Examples of data acquired from spaceborne sensors are included throughout Finally a set of exercises along with a solutions manual is provided This book is based on an upper level undergraduate and first year graduate course taught by the authors at the California Institute of Technology Because of the multidisciplinary nature of the field and its applications it is appropriate for students in electrical engineering applied physics geology planetary science astronomy and aeronautics It is also recommended for any engineer or scientist interested in working in this exciting field

**Remote Sensing** Floyd F. Sabins, 2007-06-11 Designed for an introductory course in remote sensing this highly regarded text offers 28 pages with color photos Sabins trademark clarity and comprehensive coverage The first chapter vividly introduces the major remote sensing systems and the interactions between electromagnetic energy and materials that are the basis for remote sensing Six following chapters describe the major imaging systems After a digital image processing chapter Sabins devotes the rest of the text to descriptions of practical applications of remote sensing to environmental monitoring oil and mineral exploration land use and geographic information systems and natural hazards
