

Ecology

Ecology = the study of the relationships between organisms and their interactions with the environment

LEVELS OF ECOLOGICAL ORGANIZATION

Organism → population → community → ecosystem → biome → biosphere

Standards:

- Describe the levels of ecological organization (i.e., organism, populations, community, ecosystem, biome, biosphere).
- Describe characteristic biotic and abiotic components of aquatic (water) and terrestrial (land) ecosystems.

Organism - is any individual living thing.

Species - is a group of organisms so similar to one another that they can breed.

Population - are groups of individuals that belong to the same species and live in the same area.

Community - the different populations that live together in a specific area.

Ecosystem - a system composed of all the living and non-living components in an environment.

Biome - is a group of ecosystems that have the same climate and similar dominant communities.

Biosphere - is all living things and the places where they exist (air, land, water).

Biotic - A term that describes a **living** factor in an ecosystem.

Abiotic - A term that describes a **nonliving** factor in an ecosystem.

Abiotic Factors = soil, sun, water, rocks, temperature, air, gases

Biotic Factors = all plants, animals, fungi, protists and bacteria

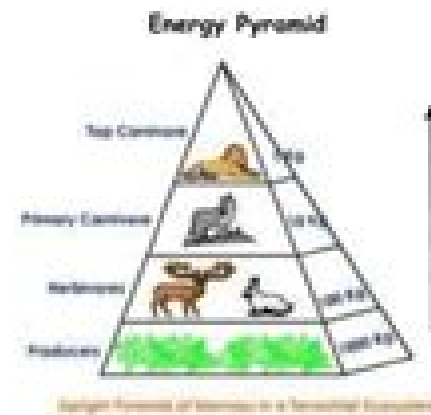

Standard:

- Describe how energy flows through an ecosystem (e.g., food chains, food webs, energy pyramids).

Food Chain - A simplified (single) path illustrating the passing of potential chemical energy (food) from one organism to another organism.

Food Web - A complex arrangement of interrelated (multiple) food chains illustrating the flow of energy between interdependent organisms.

Energy Pyramid - A model that illustrates the biomass productivity at multiple trophic levels in a given ecosystem.

- Energy is lost as you move up the energy pyramid from one trophic level to the next.
- Only 10% of the energy available within one trophic level is transferred to organisms at the next trophic level.
- There is much more energy in the producer level of a food chain than at the consumer levels.

Community Ecology Herman A. Verhoef,Peter J. Morin,2010 Community ecology is the study of the interactions between populations of co existing species Co edited by two prominent community ecologists and featuring contributions from top researchers in the field this book provides a survey of the state of the art in both the theory and applications of the discipline It pays special attention to

topology dynamics and the importance of spatial and temporal scale while also looking at applications to emerging problems in human dominated ecosystems including the restoration and reconstruction of viable communities Community Ecology Processes Models and Applications adopts a mainly theoretical approach and focuses on the use of network based theory which remains little explored in standard community ecology textbooks The book includes discussion of the effects of biotic invasions on natural communities the linking of ecological network structure to empirically measured community properties and dynamics the effects of evolution on community patterns and processes and the integration of fundamental interactions into ecological networks A final chapter indicates future research directions for the discipline **Forestry and Tree**

Education Catalogue ,1990 Conservation Study Guide Douglas D. Piirto,1991-09 **Community Ecology** Peter J. Morin,2009-04-13 Community ecology the study of the patterns and processes involving two or more species has developed rapidly in the last two decades driven by new and more sophisticated research techniques advances in mathematical theory and modeling and the increasing pressure on the environment wrought by humans Once a purely descriptive science it is now one of the most forward looking areas of scientific inquiry Morin skillfully guides the reader through the main tenets and central concepts of community ecology competition predation food webs indirect effects habitat selection diversity and succession In an attempt to introduce the reader to the most balanced coverage possible Morin includes examples drawn from both the aquatic and terrestrial realm and from both plant and animal species Balancing theory with experimentation and drawing on exciting new studies to complement the historical foundations of the discipline he also stresses that both the empirical and theoretical approaches are necessary to drive ecology forward into the new millenium The final chapter on applied community ecology ably demonstrates how community ecological processes have a wide environmental relevance Although in its infancy the application of community ecology to emerging problems in human dominated ecosystems could mitigate problems as diverse as management strategies for important diseases transmitted by animals and the restoration and reconstruction of viable communities Required reading for all students and practitioners interested in community phenomena Community Ecology marks an important contribution to the development of this protean discipline The first serious textbook for a decade on one of the keystone subdisciplines of ecology Broad taxonomic and habitat coverage Section on implications of community ecology for environmental issues *Student Study Guide for Biology [by]*
