

EMC Interview Questions And Answers

Q. As a SAN administrator how will you tell your boss how many drives are required for a requirement?

I will use the formula:
Total Approximate Drives required = (RAID Group IOPS / (Hard Drive Type IOPS)) + Large Random I/O adjustment + Hot Spares + System Drives

Q. How to calculate HDD capacity?

Capacity = Heads X Cylinders X Sectors X Block Size

Q. You need to provision SAN storage with a certain IOPS. How will you find what kind of disks you need?

Input/output operations per second (IOPS) is the measure of how many input/output operations a storage device can complete within one second. IOPS is important for transaction-based applications. IOPS performance is heavily dependent on the number and type of disk drives. To calculate IOPS of a Hard disk drive:
1

$$\text{IOPS} = \frac{1}{(\text{Average Latency}) + (\text{Average Seek Time})}$$

To calculate IOPS in a RAID:
(Total Workload IOPS * Percentage of workload that is read operations) + (Total Workload IOPS * Percentage of workload that is read operations * RAID IO Penalty)

Q. How will you calculate Max IOPS an HBA Port can generate to any LUN?

Max IOPS an HBA Port can generate to any LUN = (Device Queue Depth per LUN * (1 / (Storage Latency in ms/1000)))

Q. What is Q-Depth? How to calculate it?

The queue depth is the maximum number of commands that can be queued on the system at the same time.

Q is the Queue Depth = Execution Throttle = Maximum Number of simultaneous I/O for each LUN on a particular path to the Storage Port.

Calculation of the maximum queue depth: The queue depth is the number of I/O operations that can be run in parallel on a device.

$$Q = \frac{\text{Storage Port Max Queue Depth}}{(I * L)}$$

I is the number of initiators per storage port

L is the quantity of LUNs in the storage group.

$$T = P * q * L$$

T = Target Port Queue Depth

P = Paths connected to the target port

$$Q = \frac{T}{P}$$

Q = Queue depth

Emc Storage Interview Questions
