Enumerative Invariants in Algebraic Geometry and String Theory Marcos Marino, Michael Thaddeus, Ravi Vakil, 2008-08-15 Starting in the middle of the 80s there has been a growing and fruitful interaction between algebraic geometry and certain areas of theoretical high energy physics especially the various versions of string theory Physical heuristics have provided inspiration for new mathematical definitions such as that of Gromov Witten invariants leading in turn to the solution of problems in enumerative geometry Conversely the availability of mathematically rigorous definitions and theorems has benefited the physics research by providing the required evidence in fields where experimental testing seems problematic The aim of this volume a result of the CIME Summer School held in Cetraro Italy in 2005 is to cover part of the most recent and interesting findings in this subject

Topological String Theory and Enumerative Geometry, 2003 In this thesis we investigate several problems which have their roots in both topological string theory and enumerative geometry In the former case underlying theories are topological field theories whereas the latter case is concerned with intersection theories on moduli spaces A permeating theme in this thesis is to examine the close interplay between these two complementary fields of study The main problems addressed are as follows In considering the Hurwitz enumeration problem of branched covers of compact connected Riemann surfaces we completely solve the problem in the case of simple Hurwitz numbers In addition utilizing the connection between Hurwitz numbers and Hodge integrals we derive a generating function for the latter on the moduli space $\bar{M}_{g,2}$ of 2 pointed genus g Deligne Mumford stable curves We also investigate Givental's recent conjecture regarding semisimple Frobenius structures and Gromov Witten invariants both of which are closely related to topological field theories we consider the case of a complex projective line P^1 as a specific example and verify his conjecture at low genera In the last chapter we demonstrate that certain topological open string amplitudes can be computed via relative stable morphisms in the algebraic category

Enumerative Geometry and String Theory Sheldon Katz, 2006

Perhaps the most famous example of how ideas from modern physics have revolutionized mathematics is the way string theory has led to an overhaul of enumerative geometry an area of mathematics that started in the eighteenth century. Old problems of enumerating geometric configurations have now been solved using new and deep mathematical techniques inspired by physics. The book begins with an insightful introduction to enumerative geometry. From there the goal becomes explaining the more advanced elements of enumerative algebraic geometry. Along the way there are some crash courses on intermediate topics which are essential tools for the student of modern mathematics such as cohomology and other topics in geometry. The physics content assumes nothing beyond a first undergraduate course. The focus is on explaining the action principle in physics, the idea of string theory and how these directly lead to questions in geometry. Once these topics are in place the connection between physics and enumerative geometry is made with the introduction of topological quantum field theory and quantum cohomology.

Advances in String Theory Eric R. Sharpe, Arthur Greenspoon, 2008 Over the past decade string theory has had an increasing impact on many areas of physics: high energy and hadronic physics, gravitation and cosmology, mathematical physics and even condensed matter physics. The impact has been through many major conceptual and methodological developments in quantum field theory in the past fifteen years. In addition, string theory has exerted a dramatic influence on developments in contemporary mathematics including Gromov-Witten theory, mirror symmetry in complex and symplectic geometry and important ramifications in enumerative geometry. This volume is derived from a conference of younger leading practitioners around the common theme: What is string theory? The talks covered major current topics both mathematical and physical related to string theory. Graduate students and research mathematicians interested in string theory in mathematics and physics will be interested in this workshop.

BOOK JACKET Chern-Simons Theory, Matrix Models, and Topological Strings Marcos Marino, 2005-09-22 In recent years the old idea that gauge theories and string theories are equivalent has been implemented and developed in various ways and there are by now various models where the string theory gauge theory correspondence is at work. One of the most important examples of this correspondence relates Chern-Simons theory, a topological gauge theory in three dimensions which describes knot and three-manifold invariants to topological string theory which is deeply related to Gromov-Witten invariants. This has led to some surprising relations between three-manifold geometry and enumerative geometry. This book gives the first coherent presentation of this and other related topics. After an introduction to matrix models and Chern-Simons theory the book describes in detail the topological string theories that correspond to these gauge theories and develops the mathematical implications of this duality for the enumerative geometry of Calabi-Yau manifolds and knot theory. It is written in a pedagogical style and will be useful reading for graduate students and researchers in both mathematics and physics willing to learn about these developments.

Recent Progress in Mathematics Nam-Gyu Kang, Jaigyoung Choe, Kyeongso Choi, Sang-hyun Kim, 2022-09-30 This book consists of five chapters presenting problems of current research in mathematics with its history and development. Current

state and possible future direction Four of the chapters are expository in nature while one is based more directly on research All deal with important areas of mathematics however such as algebraic geometry topology partial differential equations Riemannian geometry and harmonic analysis This book is addressed to researchers who are interested in those subject areas Young Hoon Kiem discusses classical enumerative geometry before string theory and improvements after string theory as well as some recent advances in quantum singularity theory Donaldson Thomas theory for Calabi Yau 4 folds and Vafa Witten invariants Dongho Chae discusses the finite time singularity problem for three dimensional incompressible Euler equations He presents Kato's classical local well posedness results Beale Kato Majda's blow up criterion and recent studies on the singularity problem for the 2D Boussinesq equations Simon Brendle discusses recent developments that have led to a complete classification of all the singularity models in a three dimensional Riemannian manifold He gives an alternative proof of the classification of noncollapsed steady gradient Ricci solitons in dimension 3 Hyeonbae Kang reviews some of the developments in the Neumann Poincare operator NPO His topics include visibility and invisibility via polarization tensors the decay rate of eigenvalues and surface localization of plasmon singular geometry and the essential spectrum analysis of stress and the structure of the elastic NPO Danny Calegari provides an explicit description of the shift locus as a complex of spaces over a contractible building He describes the pieces in terms of dynamically extended laminations and of certain explicit discriminant like affine algebraic varieties
