Rebouças Ju, 2021 **Using Explanatory Item Response Models to Evaluate Complex Scientific Tasks Designed for the Next Generation Science Standards** Tina Chiu, 2016 This dissertation includes three studies that analyze a new set of assessment tasks developed by the Learning Progressions in Middle School Science LPS Project These assessment tasks were designed to measure science content knowledge on the structure of matter domain and scientific argumentation while following the goals from the Next Generation Science Standards NGSS The three studies focus on the evidence available for the success of this design and its implementation generally labelled as validity evidence I use explanatory item response models EIRMs as the overarching framework to investigate these assessment tasks These models can be useful when gathering validity evidence for assessments as they can help explain student learning and group differences In the first study I explore the dimensionality of the LPS assessment by comparing the fit of unidimensional between item multidimensional and Rasch testlet models to see which is most appropriate for this data By applying multidimensional item response models multiple relationships can be investigated and in turn allow for a more substantive look into the assessment tasks The second study focuses on person predictors through latent regression and differential item functioning DIF models Latent regression models show the influence of certain person characteristics on item responses while DIF models test whether one group is differentially affected by specific assessment items after conditioning on latent ability Finally the last study applies the linear logistic test model LLTM to investigate whether item features can help explain differences in item difficulties **Item**

Handbook of Item Response Theory Modeling Steven P. Reise, Dennis A. Revicki, 2014-11-20

Item response theory (IRT) has moved beyond the confines of educational measurement into assessment domains such as personality, psychopathology, and patient-reported outcomes. Classic and emerging IRT methods and applications that are revolutionizing psychological measurement, particularly for health assessments used to demonstrate treatment effectiveness, are reviewed in this new volume. World-renowned contributors present the latest research and methodologies about these models along with their applications and related challenges. Examples using real data, some from NIH PROMIS, show how to apply these models in actual research situations. Chapters review fundamental issues of IRT, modern estimation methods, testing assumptions, evaluating fit, item banking, scoring in multidimensional models, and advanced IRT methods. New multidimensional models are provided along with suggestions for deciding among the family of IRT models available. Each chapter provides an introduction, describes state-of-the-art research methods, demonstrates an application, and provides a summary. The book addresses the most critical IRT conceptual and statistical issues confronting researchers and advanced students in psychology, education, and medicine today. Although the chapters highlight health outcomes data, the issues addressed are relevant to any content domain. The book addresses IRT models applied to non-educational data, especially patient-reported outcomes. Differences between cognitive and non-cognitive constructs and the challenges these bring to modeling. The application of multidimensional IRT models designed to capture typical performance data. Cutting-edge methods for deriving a single latent dimension from multidimensional data. A new model designed for the measurement of constructs that are defined on one end of a continuum, such as substance abuse. Scoring individuals under different multidimensional IRT models and item banking for patient-reported health outcomes. How to evaluate measurement invariance, diagnose problems with response categories, and assess growth and change. Part 1 reviews fundamental topics such as assumption testing, parameter estimation, and the assessment

of model and person fit New emerging and classic IRT models including modeling multidimensional data and the use of new IRT models in typical performance measurement contexts are examined in Part 2 Part 3 reviews the major applications of IRT models such as scoring item banking for patient reported health outcomes evaluating measurement invariance linking scales to a common metric and measuring growth and change The book concludes with a look at future IRT applications in health outcomes measurement The book summarizes the latest advances and critiques foundational topics such a multidimensionality assessment of fit handling non normality as well as applied topics such as differential item functioning and multidimensional linking Intended for researchers advanced students and practitioners in psychology education and medicine interested in applying IRT methods this book also serves as a text in advanced graduate courses on IRT or measurement Familiarity with factor analysis latent variables IRT and basic measurement theory is assumed
