Lignalli, 2009 Diabetes mellitus type 2 or Type 2 Diabetes formerly called non insulin dependent diabetes mellitus NIDDM or adult onset diabetes is a metabolic disorder that is primarily characterised by insulin resistance relative insulin deficiency and hyperglycemia It is often managed by increasing exercise and dietary modification although medications and insulin are often needed especially as the disease progresses It is rapidly increasing in the developed world and there is some evidence that this pattern will be followed in much of the rest of the world in coming years CDC has characterised the increase as an epidemic In addition whereas this disease used to be also seen primarily in adults over age 40 in contrast to type 1 diabetes it is now increasingly seen in children and adolescents an

increase thought to be linked to rising rates of obesity in this age group although it remains a minority of cases Unlike type 1 diabetes there is little tendency toward ketoacidosis in type 2 diabetes though it is not unknown One effect that can occur is nonketonic hyperglycemia which also is quite dangerous though it must be treated very differently Complex and multifactorial metabolic changes very often lead to damage and function impairment of many organs most importantly the cardiovascular system in both types This leads to substantially increased morbidity and mortality in both Type 1 and Type 2 patients but the two have quite different origins and treatments despite the similarity in complications This comprehensive book deals with type 2 diabetes in the middle aged and elderly Curtain Times Otis Love Guernsey (Jr.),1987
