*Reports* Sean Merrell, 2000 The engineering research reports in this document resulted from the ninth year of the undergraduate Transportation Engineering Fellows Program during the summer of 2000 The ten week program sponsored by the Advanced Institute program of the Southwest Region University Transportation Center SWUTC the Texas Transportation Institute TTI and the Civil Engineering Department at Texas A M University provides undergraduate students in Civil Engineering with the opportunity to learn more about transportation engineering through participation in a transportation research program The program design allows the students to interact directly with a faculty member or TTI researcher in developing a research proposal conducting appropriate research and documenting the research results This compendium contains reports on two transportation research projects One paper documents an evaluation of signal control strategies using data from Wellborn Road and the CORSIM simulation model A few recommendations for additional studies were made based on the procedures developed in the project No specific conclusions could be drawn concerning specific control strategy changes The other paper compares the perception of the Houston Metro bus service and the bus volume and ridership Past bus volumes and perception were compared and used with future scenarios An all bus plan and a projection of the light rail operating condition were used as comparison cases Several case specific conclusions were drawn from the analysis as well as some general conclusions concerning the methodology used **Field Manual for Configuring**

**Plans in Traffic Responsive Signal Systems** Kevin N. Balke, K. S. Rao, Mark Husted, 1998 As part of this research project a computer program SIGTRAN was developed to estimate the impacts of the transition phase when changing timing plans The program uses the same procedures as PASSER II 90 to compute the estimated delay due to transition Using the SIGTRAN program a proposed algorithm for selecting new timing plans in a traffic responsive mode was developed The algorithm compares the delay associated with retaining the old traffic signal timing to the delay associated with implementing a new timing plan plus the delay caused by transitioning to the new timing plan If the delay for the old timing plan exceeded the delay estimates for the new timing plan plus the delay accrued during transition then the new timing plan was adopted otherwise the old timing plan was retained The new algorithm was tested using data from NASA Road 1 in Houston Texas It

was found that the traffic responsive timing plans developed using the algorithm produced substantial delay savings in the A M peak and noon periods over operating the signals in a time of day mode Less significant delay savings were generated during the A M off peak P M off peak and P M peak periods During these periods either traffic volumes did not change significantly or the differences in the timing plans were so slight that most of the benefits of changing timing plans were offset by the increase in delays caused by transitioning to the new timing plans      **Road Traffic Management, 98/99**
