Femtosecond Laser Matter Interaction Theory Experiments And Applications:

Femtosecond Laser-Matter Interaction Eugene G. Gamaly, 2011-10-06 This is the first comprehensive treatment of the interaction of femtosecond laser pulses with solids at nonrelativistic intensity It connects phenomena from the subtle atomic motion on the nanoscale to the generation of extreme pressure and temperature in the interaction zone confined inside a solid The femtosecond laser matter interaction has already found numerous applications in industry medicine and materials science However there is no consensus on the interpretation of related phenomena With mathematics kept to a minimum this is a highly engaging and readable treatment for students and researchers in science and engineering The book avoids complex mathematical formulae and hence the content is accessible to nontechnical readers Useful summaries after each chapter provide compressed information for quick estimates of major parameters in planned or performed experiments The book connects the basic physics of femtosecond laser solid interactions to a broad range of applications Throught the text basic assumptions are derived from the first principles and new results and ideas are presented From such analyses a qualitative and predictive framework for the field emerges the impact of which on applications is also discussed

Femtosecond Laser-Matter Interactions Eugene G. Gamaly, 2022-01-31 This book describes the ultra short laser matter interactions from the subtle atomic motion to the generation of extreme pressures inside the bulk of a transparent crystal It is the successor to Femtosecond Laser Matter Interactions Theory Experiment and Applications 2011 Explanation and experimental verification of the exceptional technique for the phase transformations under high pressure are in the core of the book The novel phase formation occurs along the unique solid plasmasolid transformation path the memory of the initial state is lost after conversion to plasma New phase forms from chaos during the cooling to the ambient The pressure affected material remains detained inside a pristine crystal at the laboratory tabletop Unique super dense aluminium and new phases of silicon were created by the confined micro explosions The text also describes the recent studies that used the quasi non diffracting Bessel beams The applications comprise the new high pressure material formation and micromachining The book is an appealing source for readers interested in the cutting edge research exploring extreme conditions and creating nanostructures at the laboratory tabletop

Pulsed Laser Ablation Ion N. Mihailescu, Anna Paola Caricato, 2018-01-09 Pulsed laser based techniques for depositing and processing materials are an important area of modern experimental and theoretical scientific research and development with promising challenging opportunities in the fields of nanofabrication and nanostructuring Understanding the interplay between deposition processing conditions laser parameters as well as material properties and dimensionality is demanding

for improved fundamental knowledge and novel applications This book introduces and discusses the basic principles of pulsed laser matter interaction with a focus on its peculiarities and perspectives compared to other conventional techniques and state of the art applications The book starts with an overview of the growth topics followed by a discussion of laser matter interaction depending on laser pulse duration background conditions materials and combination of materials and structures The information outlines the foundation to introduce examples of laser nanostructuring processing of materials pointing out the importance of pulsed laser based technologies in modern nano science With respect to similar texts and monographs the book offers a comprehensive review including bottom up and top down laser induced processes for nanoparticles and nanomicrostructure generation Theoretical models are discussed by correlation with advanced experimental protocols in order to account for the fundamentals and underline physical mechanisms of laser matter interaction Reputed internationally recognized experts in the field have contributed to this book In particular this book is suitable for a reader graduate students as well as postgraduates and more generally researchers new to the subject of pulsed laser ablation in order to gain physical insight into and advanced knowledge of mechanisms and processes involved in any deposition processing experiment based on pulsed laser matter interaction Since knowledge in the field is given step by step comprehensively this book serves as a valid introduction to the field as well as a foundation for further specific readings

High-Energy-Density Physics R Paul Drake, 2018-01-02 The raw numbers of high energy density physics are amazing shock waves at hundreds of km s approaching a million km per hour temperatures of millions of degrees and pressures that exceed 100 million atmospheres This title surveys the production of high energy density conditions the fundamental plasma and hydrodynamic models that can describe them and the problem of scaling from the laboratory to the cosmos Connections to astrophysics are discussed throughout The book is intended to support coursework in high energy density physics to meet the needs of new researchers in this field and also to serve as a useful reference on the fundamentals Specifically the book has been designed to enable academics in physics astrophysics applied physics and engineering departments to provide in a single course an introduction to fluid mechanics and radiative transfer with dramatic applications in the field of high energy density systems This second edition includes pedagogic improvements to the presentation throughout and additional material on equations of state heat waves and ionization fronts as well as problem sets accompanied by solutions **Instabilities in**

Laser-Matter Interaction Sergei I. Anisimov, Viktor A. Khokhlov, 1995-03-23 This book describes the thermal and hydrodynamic instabilities appearing in laser matter interactions at moderate intensities These instabilities result in the distortion of phase transition front dispersion of target material in condensed phase formation of dissipative surface structures generation of complex oscillatory evaporation modes and so on These effects in turn lead to the appearance of liquid droplets in an expanding vapor non uniform removal of a solid material and the enhanced light absorption in the vapor plume This book focuses on nonresonant interactions It concentrates on the range of low and moderate laser intensities that

are important for technological applications of lasers
