Using Advanced Search Techniques

When using the full-text search feature in the online user guide, the following techniques can help you narrow your searches for more precise results.

You can search for words using **words and expressions**. For example, searching for the single word **cut** will find all topics containing the terms "cut", "cuts", "cutting", and "cutting" and so on.

Searching for a phrase in **quotation marks** ("toolholder") will find all topics that contain the literal phrase "toolholder". Without the quotation marks, the query is equivalent to specifying **tool AND holder**, which will find topics containing both of the individual words, instead of the phrase.

The **Boolean operators** AND, OR, NOT, and NEAR (within eight words) enable you to precisely define your search by creating a relationship between search terms. If no operator is specified, AND is used. For example, the query **toolholder graphics** is equivalent to searching for all topics containing the terms tool AND holder AND graphic.

Nested expressions allow you to create complex searches for information. For example, the search for **milling AND (cycle OR operation) NEAR surface** finds topics containing the word "milling" along with the words "cycle" and "surface" close together, or containing "milling" along with the words "operation".
