Verification introduces a model based approach to system level design It presents modeling techniques for both computation and communication at different levels of abstraction such as specification transaction level and cycle accurate level It discusses synthesis methods for system level architectures embedded software and hardware components Using these methods designers can develop applications with high level models which are automatically translatable to low level implementations This book furthermore describes simulation based and formal verification methods that are essential for achieving design confidence The book concludes with an overview of existing tools along with a design case study outlining the practice of embedded system design Specifically this book addresses the following topics in detail System modeling at different abstraction levels Model based system design Hardware Software codesign Software and Hardware component synthesis System verification This book is for groups within the embedded system community students in courses on embedded systems embedded application developers system designers and managers CAD tool developers design automation and system engineering *IEEE Circuits & Devices* ,2005 <u>Processor Description Languages</u> Prabhat Mishra,Nikil Dutt,2011-07-28 Efficient design of embedded processors plays a critical role in embedded systems design Processor description languages and their associated specification exploration and rapid prototyping methodologies are used to find the best possible design for a given set of applications under various design constraints such as area power and performance This book is the first comprehensive survey of modern architecture description languages and will be an invaluable reference for embedded system architects designers developers and validation engineers Readers will see that the use of particular architecture description languages will lead to productivity gains in designing particular application specific types of embedded processors Comprehensive coverage of all modern architecture description languages use the right ADL to design your processor to fit your application Most up to date information available about each architecture description language from the developers save time chasing down reliable documentation Describes how each architecture desccription language enables key design automation tasks such as simulation synthesis and testing fit the ADL to your design cycle *C/C++ Users Journal* ,2005 **System Design with SystemC™** Thorsten Grötker,2002-05-31 The emergence of the system on chip SoC era is creating many new challenges at all stages of the design process Engineers are reconsidering how designs are specified partitioned and verified With systems and software engineers programming in C C and their hardware counterparts working in hardware description languages such as VHDL and Verilog problems arise from the use of different design languages incompatible tools and fragmented tool flows Momentum is building behind the SystemC language and modeling platform as the best solution for representing functionality communication and software and hardware implementations at various levels of abstraction The reason is clear increasing design complexity demands very fast executable specifications to validate system concepts and only C C delivers adequate levels of abstraction hardware software integration and performance System design today also demands a single common language and modeling foundation in order to make

interoperable system level design tools services and intellectual property a reality SystemC is entirely based on C C and the complete source code for the SystemC reference simulator can be freely downloaded from www systemc org and executed on both PCs and workstations System Design and SystemC provides a comprehensive introduction to the powerful modeling capabilities of the SystemC language and also provides a large and valuable set of system level modeling examples and techniques Written by experts from Cadence Design Systems Inc and Synopsys Inc who were deeply involved in the definition and implementation of the SystemC language and reference simulator this book will provide you with the key concepts you need to be successful with SystemC System Design with SystemC thoroughly covers the new system level modeling capabilities available in SystemC 2 0 as well as the hardware modeling capabilities available in earlier versions of SystemC designed and implemented the SystemC language and reference simulator this book will provide you with the key concepts you need to be successful with SystemC System Design with SystemC will be of interest to designers in industry working on complex system designs as well as students and researchers within academia All of the examples and techniques described within this book can be used with freely available compilers and debuggers no commercial software is needed Instructions for obtaining the free source code for the examples obtained within this book are included in the first chapter *Combining Formal Model-based System-level Design with SystemC Transaction Level Modeling* Jens Gladigau,2012 System Level Modeling and Design Using SysML and SystemC Waseem Mohamed Raslan,American University in Cairo,2007 Transaction-Level Modeling with SystemC Frank Ghenassia,2005-11-28 Suitable for bookstore catalogue **Formal Methods and Models for System Design** Rajesh Gupta,Paul Le Guernic,Sandeep Kumar Shukla,Jean-Pierre Talpin,2004-06-30 Perhaps nothing characterizes the inherent heterogeneity in embedded sys tems than the ability to choose between hardware and software implementations of a given system function Indeed most embedded systems at their core repre sent a careful division and design of hardware and software parts of the system To do this task effectively models and methods are necessary functionality to capture application behavior needs and system implementation constraints Formal modeling can be valuable in addressing these tasks As with most engineering domains co design practice defines the state of the it seeks to add new capabilities in system conceptualization mod art though eling optimization and implementation These advances particularly those related to synthesis and verification tasks direct1y depend upon formal under standing of system behavior and performance measures Current practice in system modeling relies upon exploiting high level programming frameworks such as SystemC EstereI to capture design at increasingly higher levels of ab straction and attempts to reduce the system implementation task While raising the abstraction levels for design and verification tasks to be really useful these approaches must also provide for reuse adaptation of the existing intellectual property IP blocks *Automatic Generation of Transaction Level Models* Lucky Lochi Yu Lo,2010-08-01 The rising complexity in system designs over the past decades poses great challenges to current designers One way to cope with this challenge has been to raise the level of abstraction of design

reducing the number of elements and speeding up design decisions Transaction Level Models TLM have emerged as a new alternative to design Multi Processor System on Chips MPSoC This book aims to contribute in different aspects a definition of a modeling style for SystemC TLMs a definition of a data structure complete and flexible enough to describe a complete embedded system and generation algorithms that would use it to automatically produce an executable TLM in SystemC With this approach automatic generation of TLMs can be achieved freeing the designer from error prone manual coding and allowing a focus on higher level design decisions speeding up the overall design phase *System Level Design with .Net Technology* El Mostapha Aboulhamid,Frederic Rousseau,2018-10-03 The first book to harness the power of NET for system design System Level Design with NET Technology constitutes a software based approach to design modeling verification and simulation World class developers who have been at the forefront of system design for decades explain how to tap into the power of this dynamic programming environment for more effective and efficient management of metadata and introspection and interoperability between tools Using readily available technology the text details how to capture constraints and requirements at high levels and describes how to percolate them during the refinement process Departing from proprietary environments built around System Verilog and VHDL this cutting edge reference includes an open source environment ESys NET that readers can use to experiment with new ideas algorithms and design methods and to expand the capabilities of their current tools It also covers Modeling and simulation including requirements specification IP reuse and applications of design patterns to hardware software systems Simulation and validation including transaction based models accurate simulation at cycle and transaction levels cosimulation and acceleration technique as well as timing specification and validation Practical use of the ESys NET environment Worked examples end of chapter references and the ESys NET implementation test bed make this the ideal resource for system engineers and students looking to maximize their embedded system designs *System Level Design with SystemC* Daghan S. Altas,2000 In this thesis we provide a system level design methodology aimed for the design of embedded systems Our methodology is geared towards the concurrent design of hardware components and software agents Our choice of tool language pair is CoWare N2C design tool and SystemC specification language Our design flow is completed with a high performance hardware synthesis methodology relying behavioral synthesis A case study the design of an ATM switch is carried out to illustrate the proposed ideas *System-level Design Refinement Using SystemC* Robert Dale Walstrom,2005 Embedded systems have become increasingly complex with the advent of the system on a chip SOC era Today a typical SOC may consist of one or more processor cores dedicated hardware processing units peripheral devices on chip memories and the logic for a sophisticated communications network to link all of these components together In order to deal with the complexity of designing a SOC designers needed new design languages and tools System level design languages SLDLs and EDA tools allow designers to manage this complexity by using different levels of abstraction to define and model the system Several SLDLs have been introduced in recent years most

notably SpecC developed at the University of California Irvine and SystemC developed by the Open SystemC Initiative OSCI In some aspects these SLDLs share the same goals Both support the ability to model a system at various levels of abstraction and the reuse of intellectual property However while SystemC claims the most industry support with a wide variety of supported tools available from major EDA vendors it lacks a well defined refinement methodology like that of SpecC The SpecC refinement methodology leads designers from its highest level of abstraction down to its lowest level of abstraction While each level of abstraction in SystemC is clearly defined it is not clear what changes need to be made to convert a design from one level of abstraction to another In order to facilitate a system level design approach SystemC needs well defined methodology for bringing a model defined at the highest level of abstraction down to the lowest level of abstraction This thesis presents a top down refinement methodology for systems modeled in SystemC Since SystemC has gained widespread industry support such a methodology would make it easier for designers who use SystemC to refine their design and use the SystemC language as intended by a system level design approach   System-level Modeling and Design with the SpecC Language Rainer Dömer,2000   **SystemC Kernel Extensions for Heterogeneous System Modeling** Hiren Patel,Sandeep Kumar Shukla,2008-11-01 SystemC Kernel Extensions for Heterogeneous System Modeling is a result of an almost two year endeavour on our part to understand how SystemC can be made useful for system level modeling at higher levels of abstraction Making it a truly heterogeneous modeling language and platform for hardware software co design as well as complex embedded hardware designs has been our focus in the work reported in this book
