## **Executive Function Preschool Children Neurodevelopment:**

Executive Function in Preschool-age Children James Alan Griffin, Peggy D. McCardle, Lisa Freund, 2016 A primary aim of the neuropsychological revolution has been the mapping of what has come to be known as executive function EF This term encompasses a range of mental processes such as working memory inhibitory control and cognitive flexibility that together regulate our social behavior and our emotional and cognitive well being In this book top scientists from a variety of fields investigate executive function as it develops in early childhood Because researchers differ in their conceptualizations of basic processes and even in how they define EF itself contributors begin by discussing comparability and replicability key issues which are of primary importance to those seeking to move the field to a new level of rigor Next they tackle the nuts and bolts of the development of EF in preschoolers including the neurobiological mechanisms and circuitry that underlie EF development as well as the role of EF in assessing risk and its counterpart resilience Finally they highlight exciting new clinical applications of EF research including the use of EF in contextualizing and assessing family risk the impact of socioeconomic status on neurological development and the promotion of EF development through early education programs R sum de l diteur PsycINFO Database Record c 2015 APA all rights reserved

Neurodevelopmental Outcomes of Preterm Birth Chiara Nosarti, Robin M. Murray, Maureen Hack, 2010-04-08 The improved survival of very preterm and very low birth weight infants in recent decades has been associated with an increase in the prevalence of physical and neurodevelopmental problems Attention is increasingly being focused on the quality of life of survivors who are at greater risk of brain damage and consequent neurological disorders and neuropsychological and behavioural impairments In this volume leading experts present a comprehensive and up to date perspective on research in various aspects of the long term consequences of very preterm birth As well as extending existing knowledge of the neurodevelopmental sequelae following very preterm birth a shared aim of this burgeoning body of

research is to identify the mechanisms underlying variations in outcome and thus recognise subgroups of children who are at increased risk of neurodevelopmental problems for whom appropriate intervention strategies can be devised. Pediatricians, neurologists, psychiatrists and psychologists will all find this to be essential reading.

Readers will come away with the information they need to improve outcomes for the NICU infant. **Neurodevelopmental Disorders**

**Across the Lifespan** Emily K. Farran, Annette Karmiloff-Smith, 2012 This book is unique in presenting evidence on development across the lifespan across multiple levels of description: genetic, brain, cognitive, environmental. The authors use a well-defined disorder, Williams syndrome, to explore the impact of genes, brain development, behaviour as well as the individual's environment on development. **Handbook of Clinical Child Neuropsychology** Cecil R. Reynolds, Elaine

Fletcher-Janzen, 2009-01-13 Every chapter has been updated to reflect current thought and research in the field. Chapters devoted to specialized tests in neuropsychology have been updated to reflect new editions of these popular instruments. Special topic chapters have been added such as working in pediatric coma, rehabilitation using the planning attention sequential simultaneous theory of neuropsychological processes, additions on ADHD and more, appear written by the leading experts and practitioners in these fields to reflect the demands of current practice in clinical child neuropsychology.

Deciphering serotonin's role in neurodevelopment Dirk Schubert, 2014-10-03 One of the most challenging questions in neurobiology to tackle is how the serotonergic system steers neurodevelopment. With the increase in serotonergic anxiolytic and antidepressant drugs, serotonin was thought to signal adversity or to serve as an emotional signal. However, a vast amount of literature is accumulating showing that serotonin rather mediates neuroplasticity and plays a key role in early developmental processes. For instance, selective serotonin reuptake inhibitors (SSRIs) serving as antidepressants increase

neurogenesis and trigger autism related brain and behavioural changes during embryonic and perinatal exposure Moreover serotonin transporter gene variation is associated with alterations in corticolimbic neuroplasticity autism related neuroanatomical changes as well alterations in social behaviour Hence the view is emerging that early life changes in serotonin levels influence the developmental course of socio emotional brain circuits that are relevant for autism and other neurodevelopmental disorders It is particularly exciting that the effects of embryonic and perinatal SSRI exposure and serotonin transporter gene variation on neurodevelopment seem to overlap to a large extent at the cellular as well as the behavioural level Yet the precise mechanisms by which serotonin mediates neurodevelopment in the normal and autistic brain is unclear Whereas serotonin has a placental origin during early gestation serotonergic neurons develop during midgestation under the control of a cascade of transcription factors determining the fate of mid hindbrain neurons that together form the Raphe nuclei These neurons are among the earliest neurons to be generated and because serotonin is released before any conventional synapses are formed serotonin is suspected to influence crucial neurodevelopmental processes such as proliferation migration and network formation During late gestation they target their final destinations in for instance the cortex where they affect the secretion of reelin Reelin is a secreted extracellular matrix glycoprotein that helps to regulate processes of neuronal migration and positioning in the developing cortex by controlling cell cell interactions During the late prenatal and early postnatal phase in rodents serotonin further shapes the outgrowth of projecting neurons synaptic connectivity and the morphology of white fiber tracts This is under the influence of transient serotonin transporter expression in thalamo cortical projections sensory and prefrontal cortices and the hippocampus as well as the local expression patterns of 5 HT1A 5 HT1B and 5 HT3A receptors that each exert their specific roles in neuronal migration remodeling of axons and controlling dendritic complexity There is also evidence that serotonin influences neural activity in locus ceruleus neurons Hence serotonin appears to influence the development of both short and long distance connections in the brain This Research Topic is devoted to studies pinpointing the neurodevelopmental effects of serotonin in relation to prenatal SSRI exposure serotonin transporter gene variation and autism neurodevelopmental disorders using a wide variety of cellular and molecular neurobiological techniques like epi genetics knockout knockdown neuroanatomy physiology MRI and behaviour in rodents and humans We especially encouraged attempts to cross link the neurodevelopmental processes across the fields of prenatal SSRI exposure serotonin transporter gene variation and autism neurodevelopmental disorders as well as new views on the positive or beneficial effects on serotonin mediated neurodevelopmental changes

**Emotion Regulation in Neurodevelopmental Disorders: Current Understanding and Treatments** Ru Ying Cai,Andrea C. Samson ,Mirko Uljarevic,2024-08-12 Emotion regulation allows people to influence and modify the intensity duration and types of emotions experienced and how these emotions are expressed The capacity to regulate emotions increases and becomes more sophisticated throughout child development due to the maturation of prefrontal brain regions involved in

executive functioning Emotion regulation is a transdiagnostic process that plays a pivotal role in the development and maintenance of internalizing and externalizing symptoms such as anxiety depression or problematic behaviors Emotion dysregulation is a prominent feature of neurodevelopmental conditions such as autism spectrum disorder ASD and attention deficit hyperactivity disorder ADHD Furthermore emotion dysregulation has been suggested to play a vital role in less commonly diagnosed neurogenetic disorders such as Phelan McDermid Syndrome germline heterozygous PTEN mutations and 22q11.2 deletion syndrome Fortunately emotion regulation processes are amenable to treatment in various clinical and non clinical populations

The Neurodevelopment Profile and Early Executive Function as a Protective Factor in Developmental Deficits in Young Children with Neonatal Hypoglycaemia and Cumulative Risk Ryan Jim San Diego, 2017 Background Maintenance of low blood glucose levels approximately 2.6 mmol/L or 47 mg/dL in newborns showed no adverse effects on the neurodevelopment of young children at 2 years N 404 and at 4.5 years of age N 355 enrolled in the Children with Neonatal Hypoglycaemia and their Later Development CHYLD study However recent evidence suggests that primary risks of neonatal hypoglycaemia such as gestational diabetes prematurity born small or born large might increase the chance of developmental deficits in young children Guided by the bio ecological framework this doctoral thesis evaluates the effect of early cumulative risk and its effect on the neurocognitive and neurobehavioral development in preschool children Integrative person focused and variable focused strategies were found useful in the evaluation of child neurodevelopment Methods Six studies were performed in order to determine a the impact of cumulative risk on child development and b the developmental trajectory of cognitive constructs in at risk young children 1 A cluster analysis of risk factors and outcomes at 2 year and 4.5 year follow ups in the CHYLD cohort and validation of the 5 cluster solution 2 A multivariate analysis to identify group differences in neurodevelopment of at risk young children at 2 years and at 4.5 years

of age 3 A validation of the 2 cluster solution the identification of risk predictors and profile of children in more at risk and less at risk groups at 4 5 years 4 Factor analysis of two measures of executive function at 2 years and at 4 5 years of age and comparison of factor loadings in less at risk children versus more at risk children 5 A path analytic model to estimate the relationship between general intelligence and executive function and the cascade impact of cumulative risk on working memory processing speed reasoning abilities and motor development at 4 5 years of age 6 A path analytic model to estimate the impact of cumulative risk on neurobehaviour and the relationship between parent rated executive function and measures of child psychopathology at 4 5 years of age Results 1 The use of child risk factors birth characteristics primary risk factors of neonatal hypoglycaemia parent substance use history socioeconomic status maternal education were useful to aggregate patterns of neurodevelopment in at risk young children at 2 years and at 4 5 years 2 Significant differences were observed among groups Neurodevelopmental deficits were observed in groups 1 2 and 3 These groups of at risk young children are more likely living in poor family household lower maternal education most likely M ori or Pacific ethnicity and most likely born IDM and or SGA 3 Risk status less at risk versus more at risk was validated Risk status was found related to deprivation ethnic affiliation SGA and head circumference Risk factors that predicted group membership were a prenatal substance exposure b postnatal substance exposure c SGA and ethnicity and d maternal education and SES 4 More at risk young children had immature inhibition of prepotent responses compared to less at risk children at 2 years and more immature cognitive flexibility skills at 4 5 years In the parent rated measure of executive function more at risk young children have lesser inhibitory skills than less at risk children observed at 2 and at 4 5 years of age Hypothesised parent beliefs of child development were significantly influential in the evaluation of executive function in young children at 2 years and at 4 5 years 5 Intelligence was strongly associated with executive function However this relationship was compromised by the effect of cumulative risk Effects of cumulative risk on verbal reasoning were mediated by working memory whereas effects of cumulative risk on non verbal reasoning were mediated by processing speed Effects of cumulative risk on motor development were mediated by executive function and visuomotor integration Therefore the protective role of observed executive function in reasoning abilities and motor development were established 6 Parent rated executive function was highly correlated with parent reports of child psychopathology Externalising behaviour was related to inhibitory self control index whereas internalising behaviour was related to flexibility and metacognitive indices Everyday executive function mediated the effects of cumulative risk on child psychopathology However executive function only partially mediated the impact of cumulative risk on autism like behaviours Therefore the compensatory role of everyday executive function in child social adjustment was tenable Conclusions and recommendations Cumulative risk compromises the neural integrity of young children through a weakening of the global brain efficiency Subtle traces of neurodevelopmental deficits were observed in areas of language development inhibition cognitive flexibility visuomotor integration and motor development and higher parent reports of

hyperactivity aggressive behaviour inattention problems and even autism like behaviours Moderate neonatal hypoglycaemia was not related to the established risk status in children However primary risks such as born small for gestation was related to risk status These findings should be taken in light of the socio ecological context of risk configuration SES maternal education parent substance use and ethnicity Therefore follow up assessments and early intervention for the more at risk young children in the CHYLD cohort is highly recommended
