Soft Tissue Biomechanical Modeling for Computer Assisted Surgery Yohan Payan, 2012-04-27 This volume focuses on the biomechanical modeling of biological tissues in the context of Computer Assisted Surgery CAS More specifically deformable soft tissues are addressed since they are the subject of the most recent developments in this field The pioneering works on this CAS topic date from the 1980 s with applications in orthopaedics and biomechanical models of bones More recently however biomechanical models of soft tissues have been proposed since most of the human body is made of soft organs that can be deformed by the surgical gesture Such models are much more complicated to handle since the tissues can be subject to large deformations non linear geometrical framework as well as complex stress strain relationships non linear mechanical framework Part 1 of the volume presents biomechanical models that have been developed in a CAS context and used during surgery This is particularly new since most of the soft tissues models already proposed concern Computer Assisted Planning

with a pre operative use of the models Then the volume addresses the two key issues raised for an intra operative use of soft tissues models namely Part 2 how to estimate the in vivo mechanical behavior of the tissues i e what are the values of the mechanical parameters that can deliver realistic patient specific behavior and Part 3 how to build a modeling platform that provides generic real time or at least interactive time numerical simulations Next Generation Energetics Jacqueline Akhavan,2025-07-18 Held for the second time in the UK the international conference in explosives and other energetics took place in June 2024 These conferences host international academics and practitioners who share and showcase research undertaken in this area Particularly important is the part the UK plays as one of the world leaders in this area with the opportunity to provide unclassified and novel research This book contains the proceedings of this meeting and comprises unique peer reviewed papers which are highly desirable for researchers in this field Divided into two sections on synthesis characterisation and diagnostics and artificial intelligence simulation and modelling the book captures the fundamental science of explosives and energetic materials that underpins deeper understanding of explosives propellants pyrotechnics and gas generators All professionals from early careers through to subject matter experts will find topics of interest in this snapshot of research Materials Engineering and Technologies for Production and Processing IV Andrey A.
