Mark Leckie, Kate Pound, Megan Jones, Lawrence Krissek, 2021-06-25 *Reconstructing Earth's Climate History* There has never been a more critical time for students to understand the record of Earth's climate history as well as the relevance of that history to understanding Earth's present and likely future climate There also has never been a more critical time for students as well as the public at large to understand how we know as much as what we know in science This book addresses these needs by placing you the student at the center of learning In this book you will actively use inquiry based explorations of authentic scientific data to develop skills that are essential in all disciplines making observations developing and testing hypotheses reaching conclusions based on the available data recognizing and acknowledging uncertainty in scientific data and scientific conclusions and communicating your results to others The context for understanding global climate change today lies in the records of Earth's past as preserved in archives such as sediments and sedimentary rocks on land and on the seafloor as well as glacial ice corals speleothems and tree rings These archives have been studied for decades by geoscientists and paleoclimatologists Much like detectives these researchers work to reconstruct what happened in the past as well as when and how it happened based on the often incomplete and indirect records of those events preserved in these archives This book uses guided inquiry to build your knowledge of foundational concepts needed to interpret such archives Foundational concepts include interpreting the environmental meaning of sediment composition determining ages of geologic materials and events supported by a new section on radiometric dating and understanding the role of CO₂ in Earth's climate system among others Next this book provides the opportunity for you to apply your foundational knowledge to a collection of paleoclimate case studies The case

The Future of Post-Human History Peter Baofu,2012-03-15 Is history really so universalistic even when similar events happen in different contexts that as George Santayana 1905 once famously wrote t hose who cannot remember the past are condemned to repeat it This more universalistic view of history can be contrasted with an opposing view which is more relativistic in orientation as shown by the equally known remark by Winston Churchill that h istory is written by the victor to the extent that what is regarded as true in history today may not be so in another era when a new victor comes into power THEX 2011 So which of the two views is correct here Contrary to these opposing views and other ideas as will be discussed in the book history in relation to both universality and relativity is neither possible or impossible nor desirable or undesirable to the extent that the respective ideologues on different sides would like us to believe Of course this challenge to the opposing views about history does not suggest that the study of history is controversial at best or that those fields related to the study of history like political science economics military studies anthropology sociology psychology philosophy theology literature ethics and so on should be rejected too Needless to say neither of these extreme views is reasonable Rather this book offers an alternative better way to understand the future of history especially in the dialectic context of universality and relativity while learning

from different approaches in the literature but without favoring any one of them or integrating them since they are not necessarily compatible with each other. Instead, this book offers a new theory that is the multifold theory of history to go beyond the existing approaches in a novel way. If successful, this seminal project is to fundamentally change the way that we think about history from the combined perspectives of the mind, nature, society, and culture with enormous implications for the human future and what the author originally called its post-human fate.

Climate Change and the Course of Global History John L. Brooke, 2014-03-17 The first global study by a historian to fully integrate the earth system approach of the new climate science with the material history of humanity.

Future Earth Diana Dalbotten, Gillian Roehrig, Patrick Hamilton, 2014-04-08 Earth now is dominated by both biogeophysical and anthropogenic processes as represented in these two images from a simulation of aerosols. Dust (red) from the Sahara sweeps west across the Atlantic Ocean. Sea salt (blue) rises into the atmosphere from winds over the North Atlantic and from a tropical cyclone in the Indian Ocean. Organic and black carbon (green) from biomass burning is notable over the Amazon and Southeast Asia. Plumes of sulfate (white) from fossil fuel burning are particularly prominent over northeastern North America and East Asia. If present trends of dust emissions and fossil fuel burning continue in what we call the Anthropocene epoch, then we could experience high atmospheric CO₂ levels leading to unusual warming rarely experienced in Earth's history. This book focuses on human influences on land, ocean, and the atmosphere to determine if human activities are operating within or beyond the safe zones of our planet's biological, chemical, and physical systems. Volume highlights include: Assessment of civic understanding of Earth and its future; Understanding the role of undergraduate geoscience research and community-driven research on the Anthropocene; Effective communication of science to a broader audience that would include the public, the K-12 science community, or populations underrepresented in the sciences; Public outreach on climate education; geoscience alliance and scientific reasoning. *Future Earth* is a valuable practical guide for scientists from all disciplines, including geoscientists, museum curators, science educators, and public policy makers.
