Easa Test Guide:

EASA Part-66 Examination Test Guide Part-66 Examiners, 2013-07-22 Compiled by the part 66 examiners Questions are drawn from original part 66 examination paper Contains more than 10 000 probable questions with the answer and explanation very essential to pass EASA Part 66 Modules Flight Testing Steffen Haakon Schrader, 2023-03-06 As spinning is still involved in around 60% of all aircraft accidents BFU 1985 and Belcastro 2009 this aerodynamic phenomenon is still not fully understood As U S and European Certification Specifications do not require recoveries from fully developed spins of Normal Category aeroplanes certification test flights will not discover aeroplane mass and centre of gravity combinations which may result in unrecoverable spins This book aims to contribute to a better understanding of the spin phenomenon through investigating the spin regime for normal utility and aerobatic aircraft and to explain what happens to the aircraft in terms of the aerodynamics flight mechanics and the aircraft stability The approach used is to vary the main geometric parameters such as the centre of gravity position and the aeroplane s mass across the flight envelope and to investigate the subsequent effect on the main spin characteristic parameters such as the angle of attack pitch angle sideslip angle rotational rates and recovery time First of all a literature review sums up the range of technical aspects that affect the problem of spinning It reviews the experimental measurement techniques used theoretical methods developed and flight test results obtained by previous researchers The published results have been studied to extract the effect on spinning of aircraft geometry control surface effectiveness flight operational parameters and atmospheric effects Consideration is also made of the influence on human performance of spinning the current spin regulations and the available training material for pilots A conventional geometry single engine low wing aeroplane the basic trainer Fuji FA 200 160 has been instrumented with a proven digital flight measurement system and 27 spins have been systematically conducted inside and outside the certified flight envelope The accuracy of the flight measurements is ensured through effective calibration and the choice of sensors has varied through the study with earlier sensors suffering from more drift than the current sensors Belcastro 2009 and Schrader 2013 In flight parameter data collected includes left and right wing and angles roll pitch yaw angles and corresponding rates all control surface deflections vertical speeds altitude losses and the aeroplane s accelerations in all three directions Such data have been statistically analysed The pitch behaviour has been mathematically modelled on the basis of the gathered flight test data Nine observations have been proposed These mainly cover the effects of centre of gravity and aircraft mass variations on spin characteristic behaviour They have all been proven as true through the results of this thesis The final observation concerns the generalisation of the Fuji results to the spin behaviour of other aircraft in the same category These observations can be used to improve flight test programmes aircraft design processes flight training materials and hence contribute strongly to better flight safety Performance of the Jet Transport Airplane Trevor M. Young, 2019-10-24 Performance of the Jet Transport Airplane Analysis Methods Flight Operations and Regulations presents a

detailed and comprehensive treatment of performance analysis techniques for jet transport airplanes. Uniquely, the book describes key operational and regulatory procedures and constraints that directly impact the performance of commercial airliners. Topics include rigid body dynamics, aerodynamic fundamentals, atmospheric models including standard and non-standard atmospheres, height scales and altimetry, distance and speed measurement, lift and drag, and associated mathematical models, jet engine performance including thrust and specific fuel consumption, models, takeoff and landing performance with airfield and operational constraints, takeoff climb and obstacle clearance, level climbing and descending flight including accelerated climb, descent, cruise, and range including solutions by numerical integration, payload, range, endurance, and holding, maneuvering flight including turning and pitching maneuvers, total energy concepts, trip fuel planning and estimation including regulatory fuel reserves, en route operations and limitations, e.g., climb speed, schedules, cruise ceiling, ETOPS, cost considerations, e.g., cost index, energy cost, fuel tankering, weight balance and trim, flight envelopes and limitations including stall and buffet onset speeds, V_n diagrams, environmental considerations, viz. noise and emissions, aircraft systems and airplane performance, e.g., cabin pressurization, de-icing, and fuel and performance related regulatory requirements of the FAA Federal Aviation Administration and EASA European Aviation Safety Agency. Key features: Describes methods for the analysis of the performance of jet transport airplanes during all phases of flight. Presents both analytical closed form methods and numerical approaches. Describes key FAA and EASA regulations that impact airplane performance. Presents equations and examples in both SI System International and USC United States Customary units. Considers the influence of operational procedures and their impact on airplane performance.
