

Geographical Determinants of Climate

Latitude

- Latitude is the most important factor in determining climates.
- The equator receives the most solar radiation; the sun rises high during the day.
- The Polar Regions receive the least solar radiation; the sun is low, radiation filters through a thick wedge of atmosphere, and light is often reflected by ice and snow.

Study Tip

If you shine a flashlight on a basketball, you'll notice that some parts of the basketball aren't as bright as other parts. Similarly, the light from the sun hits the earth with greater intensity at some parts more than others.

Atmospheric Circulation

- **Intertropical Convergence Zone (ITCZ)** is the low-pressure area near the equator, between the Hadley cells. The air rises and condenses into clouds, creating weather that is warm and wet. The ITCZ migrates slightly upward during the summer, because the land often heats faster than water.
- Horse latitudes are boundaries between the Hadley cells and the Ferrel cells. The air descends and clouds evaporate, creating weather that is warm and dry.
- Polar fronts are the boundaries between Ferrel cells and Polar cells. Cold polar air and warm tropical air meet, creating weather that is stormy. The polar front migrates slightly as the Earth orbits the Sun.
- Prevailing winds are the bases of the three cells. They bring the weather from the locations they come from.

Upper latitudes receive less solar radiation in comparison to latitudes near the equator, resulting in lower mean temperatures

Continental Position

- A **maritime climate** is strongly influenced by the winds from nearby sea. Temperatures vary a relatively small amount, because sea currents moderate the climate with their own temperatures.
- A **continental climate** is influenced by nearby land. Temperatures are more extreme between day and night, and between summer and winter.

from the Author in Recognition of Earth Day 2024 Earth Day is a celebration of our planet the environmental goods and services it provides and the need to maintain our local to global environment in such a manner that these goods and services will continue to be provided in the centuries to come Toward that end it is necessary to understand the mechanisms that provide these services as well as the means by which they can be perturbed or destroyed This book is written with that in mind focusing on the science that controls the land water and air upon which we depend rather than the many horror stories that could be written about what happens when we ignore or abuse the various aspects of the planet we call home With facts and figures at everyone s fingertips in the form of smartphones and more there is no need for a book to be cluttered with such discussions as the size of the last oil spill but rather the focus here is on understanding how for example the greenhouse effect works what drives ozone formation and how ozone depletion leads to cancer and how a photoelectric cell can convert sunlight into electricity The book is written for non science majors and does not assume any environmental background As such it is intended to promote a broad public that is sufficiently scientifically literate to make informed decisions in their jobs homes and purchasing that help us all move toward a more sustainable future
