Economics Of Water Management In Agriculture:

Economics of Water Management in Agriculture Thomas Bournaris, Julio Berbel, Basil Manos, Davide Viaggi, 2014-08-26
This book includes a set of papers from distinguished scholars who critically examine economic issues relating to the relationship between water and agriculture with a special focus on irrigation. Employing state of the art methodologies they address the most relevant issues in water policy. The volume offers a wide spectrum of innovative approaches. *The Economics of Water Management in Southern Africa* Glenn-Marie Lange, Rashid M. Hassan, Jaap Arntzen, Jackie Crawford, Eric Mungatana, 2007-01-01
This book presents a valuable new tool for water management: water resource accounting, which significantly advances the economic analysis of water. Water resource accounts integrate detailed information about water supply and use with national income accounts to show the economic use of water, costs and tariffs paid, and the economic value of water for different economic uses. Based on the UN's handbook for environmental accounting, this book describes the implementation and policy application of water accounts in three African countries: Botswana, Namibia, and South Africa, and discusses how they have been used by water managers. The book compares water use across the three countries, explaining the differences in water resources and water policy. In addition to the comprehensive outline of physical and monetary water accounts for each country, the authors provide an extensive discussion of water valuation, as well as addressing a number of issues of regional importance, including water accounting for an international river basin and the impact of trade on each country's water use. By demonstrating the usefulness of water resource accounts, this book makes a major contribution to the literature on water economics and management, sustainable development, and to the development of environmental accounting in general. *The Economics of Water Management in Southern Africa* will appeal to a wide readership, including environmental and development economists, NGOs concerned with sustainable development, environmental advocacy groups, professionals, economists, and environmentalists working in Africa on water and sustainable development issues, water professionals, national accounts experts, and statisticians.

The Economics and Management of Water and Drainage in Agriculture Ariel Dinar, David Zilberman, 2012-12-06
Jan van Schilfgaarde, USDA Agricultural Research Service and National Research Council Committee on Irrigation-Induced Water Quality Problems
In 1982 a startling discovery was made. Many waterbirds in Kesterson National Wildlife Refuge were dying or suffering reproductive failure. Located in the San Joaquin Valley, Valley of California, the Kesterson Reservoir. Kesterson was used to store agricultural drainage water, and it was soon determined that the probable cause of the damage to wildlife was high concentrations of selenium derived from the water and water organisms in the reservoir. This discovery drastically changed numerous aspects of water management in California and especially affected irrigated agriculture. In fact, the repercussions spilled over to much of the Western United States. For a century, water development for irrigation has been a religiously pursued means for economic development of the West. The primary objective of the Reclamation Act of 1902 was purportedly the development of irrigation.

water to support family farms which in turn would enhance the regional economy Worster 1985 **Economics of Water Management in Agriculture** Bob Perez (ed),2016 Frontiers in Water Resource Economics Renan-Ulrich Goetz,Dolors Berga,2006-03-09 Most of the books published previously in the field of water resource economics focus on particular aspects of water economics such as institutions pricing or water markets but none of them have given particular attention to methodological questions However the applied methodology within economic research has made some remarkable advances over the last 10 20 years Some of these advances are of particular interest to the field of water economics Therefore we think that a book that focusing on methodological advances within the field of water resource economics and showing how these advances can be applied in economic analysis of water issues makes a nice complement to the existing literature in this field We identified five areas where we consider the methodological advances to be of particular importance 1 asymmetric information and game theory 2 uncertainty 3 space 4 water quality and 5 production and technology adoption The selected papers for the book fall entirely within these categories The book Frontiers in Water Resource Economics draws to a great extent on papers which were presented at the 7 Conference of the International Water and Resource Economics Consortium June 3 5 2001 held in Girona Catalonia Spain This conference was jointly organized with the 4 Conference of Environmental and Resource Economics by the Department of Economics University of Girona Economics of Water Resources: From Regulation to Privatization Nicolas Spulber,Asghar Sabbaghi,2012-12-06 The appearance of this Second Edition has been encouraged by the favorable reception of the first This has offered us the opportunity to update the materials and to expand the exposition of our central theses concerning 1 the integration of water quantity quality issues and the treatment of water as a multi product commodity with the market playing a major role in determining water quality discriminant pricing 2 the drawbacks of public controls regulation and enforcement and the need to expand privatization of water supply and of water and wastewater treatment facilities to ensure their appropriate development and modernization through increased reliance on private capital 3 the unification and centralization of water management on the river basin level in order to handle effectively the expanding pressures for water availability for the elimination of waterborne disease for extensive and effective pollution abatement as well as coping with the related issues of soil erosion siltation in streams channels and reservoirs protection against distress from drought and floods and with the myriad problems relating to the environment recreation and navigation We have maintained the division of the book into four major parts and 12 chapters **Water for Agriculture** Stephen Merrett,2002-03-01 Between the years 2000 and 2025 the world's population is expected to rise from six billion to about 8 billion At the present time irrigated agriculture provides one third of world food output So the advance of the irrigated sector on a global scale is a vital part of the development of the human race's capacity to feed itself This requires many skills including an economic understanding of the role of water in the irrigation and drainage of farmland The purpose of this book is to provide a text in securing such an understanding that will assist both students and professionals in the

fields of agriculture development studies geography hydrology and planning As an introduction to the subject no prior knowledge of economic theory is assumed The scope of the book is wide both in its analysis and its geographical coverage A general introduction to irrigation and to economics is followed by a treatment of farmer s need for irrigation water and the costs they face in accessing it Three chapters cover the supply side infrastructure operation and maintenance An introduction is next given to the economic evaluation of irrigation and drainage projects continuing with a consideration of water allocation between sectors at the regional level The book ends with a summary of the analysis as well as sixteen proposals for policy development The approach is to make it possible for readers from a variety of backgrounds to readily access the subject matter Each chapter begins with general analytic themes and is followed by one or two detailed case studies drawn from Australia Brazil England India the Mediterranean Mexico Pakistan Palestine the Philippines and the USA The desire is to continually interrelate theory and fieldwork in an argument that is clearly expressed well structured and as easy to read as the subject permits The book is the first of its kind published since 1981 **Water for Agriculture** Stephen Merrett,2003-08-02 World population is set to increase by a third in the next 25 years with no corresponding increase in global rainfall About seventy per cent of the world s abstracted water is used in farming and therefore the economics of irrigation is becoming an increasingly important issue for sustainable development Water for Agriculture provides a thorough

Economic Valuation of Water Resources in Agriculture R. Kerry Turner,2004-01-01 The purpose of this report is to produce a review on water resource valuation issues and techniques specifically for the appraisal and negotiation of raw as opposed to bulk or retail water resource allocation for agricultural development projects The review considers raw water in naturally occurring watercourses lakes wetlands soil and aquifers taking an ecosystem function perspective at a catchment scale and takes account of the demands from irrigated and rainfed agriculture It is hoped that the review will have particular application to developing countries where agreed methods for reconciling competing uses are often absent but nevertheless takes account of valuation approaches that have been made in post industrial economies *Water Management, Food Security and Sustainable Agriculture in Developing Economies* M. Dinesh Kumar,M.V.K. Sivamohan,Nitin Bassi,2012-11-12 This book addresses strategies for food security and sustainable agriculture in developing economies The book focuses primarily on India a fast developing economy whose natural resource base comprising land and water supporting agricultural production is not only under enormous stress but also complex and not amenable to a uniform strategy It critically reviews issues which continue to dominate the debate on water management for agricultural and food production The book examines the validity of the claim that large water resources projects cause serious social and environmental damages using global and national datasets The authors examine claims that the future of Indian agriculture is in rain fed farming supported by small water harvesting They question whether water abundant eastern India could become the granary of India through a groundwater revolution with the right policy inputs In the process they look at the less researched aspect of the food security

challenge which is land scarcity in eastern India The book analyzes the physical economic and social impacts of large scale adoption of micro irrigation systems using a farming system approach for north Gujarat Through an economic valuation of the multiple use benefits from tank systems in western Orissa it shows how value of water from large public irrigation systems could be enhanced The book also looks at the reasons for the limited success in bringing about the much needed institutional reforms in canal irrigation for securing higher productivity and equity using case studies of Gujarat Madhya Pradesh and Maharashtra Finally it addresses how other countries in the developing world particularly Sub Saharan Africa could learn from Indian experience

The Wealth of Waste J. T. Winpenny, Ingo Heinz, Sasha Koo-Oshima, 2010 In recent times the coalescence of different pressure has put a major strain on water supply globally The level of water abstraction is reaching its natural limits and this calls for a dramatic shift in water utilization concepts This publication addresses the economic and financial issues and the methodology and procedures involved in the analysis of water recycling projects as part of a comprehensive water planning process The issue is dealt within the wider context of water resources and covers human health water quality acceptability institutional constraints and other factors all of which have economic implications and affect the feasibility of reuse schemes The recycling of urban wastewater is a key link in Integrated Water Resource Management that can fulfill several different but interrelated objectives These are expressed as win win propositions delivering simultaneous benefits to farmers cities and
