- 5. No heat transfer from the rocket engine.
- 6. Flow is isentropic except across the shock.
- Uniform chamber conditions at the nozzle entrance; flow properties, namely, pressure, temperature, and density remain constant.
- Velocity at the nozzle entrance is negligibly small as compared to its exit.
- Gas composition across the nozzle remains constant. Frozen flow in the nozzle.
- 10. Gas leaves nozzle exit along axial direction only.

These simplifying assumptions are quite useful in deriving simplified performance parameters that are helpful in characterizing the chemical rocket engine. Subsequently, we will discuss the correction factors by which this idealized model can be improved further.

3.3 THRUST EQUATION OF ROCKET ENGINES

An expression for the thrust developed by a rocket engine under static condition can be obtained by applying the momentum equation. For this, let us consider a control volume (CV), as shown in Figure 3.1. The propulsive thrust "F" acts in a direction opposite to V_e . The reaction to the thrust "F" on the CV is opposite to it. The momentum equation for such CV is given by [4]

$$\frac{d}{dt} \int_{\mathcal{S}} \rho V_x \, dV + \int_{\mathcal{S}} V_x \, (\rho V_x \cdot n) dA = \sum F_x \tag{3.1}$$
