Abstract

1. In this review, we relate theoretical work on the importance of surprise in cognition to empirical research relevant to surprise in predator–prey interactions.
2. There have been multiple proposals as to how surprise should be defined and quantified in the context of animal cognition, including contributions from associative learning, information theory, Bayesian inference and the recent framework of active inference.
3. We argue that active inference provides a novel and powerful approach to quantifying surprise and advances the field by revealing how proactive behaviour on the part of predators relates to reducing surprise.
4. The active inference framework encompasses both proximate (e.g. neurobiological) and ultimate (evolutionary) aspects of surprise and brings new insights into key aspects of prey defences that exploit predator surprise.
5. We focus on surprise in defences that involve a sudden change in prey appearance (such as deimatic displays), and in defences that increase prey unpredictability (such as variation in chemical defences). We review literature that have investigated these phenomena and connect them to active inference. We also consider how multiple prey defences impact surprise in predators.
6. Finally, we consider the implications of active inference for future studies of predator–prey interactions, illustrate how this approach can be used to quantify surprise in prey defences and predict predator behaviour, and outline key questions that can be addressed within this framework.

Ecology Of Predator Prey Interactions:

Ecology of Predator-Prey Interactions Pedro Barbosa, Ignacio Castellanos, 2005-08-11 This book addresses the fundamental issues of predator prey interactions with an emphasis on predation among arthropods which have been better studied and for which the database is more extensive than for the large and rare vertebrate predators The book should appeal to ecologists interested in the broad issue of predation effects on communities

Ecology of Predator-prey Interactions Pedro Barbosa, Ignacio Castellanos, 2023 Addressing the issues of predator prey interactions with an emphasis on predation among arthropods this work will appeal to ecologists interested in the broad issue of predation effects on communities

Predator Ecology John P. DeLong, 2021 Predator prey interactions are ubiquitous govern the flow of energy up trophic levels and strongly influence the structure of ecological systems They are typically quantified using the functional response the relationship between a predator's foraging rate and the availability of food As such the functional response is central to how all ecological communities function since all communities contain foragers and a principal driver of the abundance diversity and dynamics of ecological communities The functional response also reflects all the behaviors traits and strategies that predators use to hunt prey and that prey use to evade predation It is thus both a clear reflection of past evolution including predator prey arms races and a major force driving the future evolution of both predator and prey Despite their importance there have been remarkably few attempts to synthesize or even briefly review functional responses This novel and accessible book fills this gap clearly demonstrating their crucial role as the link between individuals evolution and community properties representing a highly integrated and measurable aspect of ecological function It provides a clear entry point for students a refresher for more advanced researchers and a motivator for future research Predator Ecology is an advanced textbook suitable for graduate students and researchers in ecology and evolutionary biology seeking a broad up to date and authoritative coverage of the field It will also be of relevance and use to mathematical ecologists wildlife biologists and anyone interested in predator prey interactions

Predator-Prey Interactions in the Fossil Record Patricia Kelley, Michal Kowalewski, Thor A. Hansen, 2003-01-31 From the Foreword Predator prey interactions are among the most significant of all organism organism interactions It will only be by compiling and evaluating data on predator prey relations as they are recorded in the fossil record that we can hope to tease apart their role in the tangled web of evolutionary interaction over time This volume compiled by a group of expert specialists on the evidence of predator prey interactions in the fossil record is a pioneering effort to collate the information now accumulating in this important field It will be a standard reference on which future study of one of the central dynamics of ecology as seen in the fossil record will be built Richard K Bambach Professor Emeritus Virginia Tech Associate of the Botanical Museum Harvard University

Predator Ecology John Paul DeLong, 2021 Predator prey interactions are ubiquitous govern the flow of energy up trophic levels and strongly influence the

structure of ecological systems They are typically quantified using the functional response the relationship between a predator's foraging rate and the availability of food As such the functional response is central to how all ecological communities function since all communities contain foragers and a principal driver of the abundance diversity and dynamics of ecological communities The functional response also reflects all the behaviors traits and strategies that predators use to hunt prey and that prey use to evade predation It is thus both a clear reflection of past evolution including predator-prey arms races and a major force driving the future evolution of both predator and prey

The Spatial Ecology of Predator-Prey Interactions: A Case Study of Yellowstone Elk, Wolves, and Cougars Michel T. Kohl, 2019 Predators can serve as an important top-down driver of ecosystems via their influence on prey behavior Although predator effects on prey behavior or traits may be as strong as or stronger than predator effects on prey abundance in small scale experimental systems it is unclear whether behavioral effects are as dominant in large scale free living systems The objective of this project was to improve our ecological understanding of the spatio-temporal interactions between large predators and their primary prey source in a free living system Specifically I used data from northern Yellowstone to evaluate 1 the role of predator diel activity on prey habitat selection of risky places 2 how prey operate in a landscape composed of multiple predators that occupy different spatial and temporal niches and 3 how the density and behaviorally mediated effects of large predators influence the large scale spatial distribution of a prey population In Chapter 2 I show that the predictability of daily

wolf *Canis lupus* hunting activity provided an opportunity for elk *Cervus elaphus* to use risky places during safe times which in essence flattened i.e. minimized the landscape of fear in Yellowstone In Chapter 3 I show that wolves and cougars *Puma concolor* hunt in different places and at different times which provided a refugia from these predators in time and space that likely minimized overall predation risk in an environment that was spatially saturated with wolves and cougars In Chapter 4 I show that the current spatial distribution of elk across the northern range of Yellowstone is driven primarily by demographic rather than behavioral mechanisms Overall the results from chapters 2-4 suggest that any trophic cascade from predators to prey to deciduous woody plants in Yellowstone National Park is likely due to demographic mechanisms rather than a landscape of fear More broadly this research identifies a previously overlooked behavioral trait of predators diel activity which prey can use to minimize the effect of predators on sophisticated prey Together this study advances the field of ecology by quantifying the ecological importance of fear in a large scale free living system

Predation in Organisms

Ashraf M.T. Elewa, 2007-01-10 Predation is considered one of the distinct phenomena related to the interrelationships between species on the Earth In general predation is widespread not only in wildlife but also in marine environments where big fishes eat small fishes and other organisms of the sea This book considers predation in organisms and is aimed at the prevention of predation in wildlife and marine environments

Predator-Prey Interactions: Co-evolution between Bats and Their Prey David Steve Jacobs, Anna Bastian, 2017-02-08 This book provides a comprehensive review of the evolution of traits associated with predation and predator defense for bats and all of their prey both invertebrates e.g. insects and vertebrates e.g. frogs in the context of co-evolution It reviews current knowledge of how echolocation and passive hearing are used by bats to hunt prey in complete darkness Also it highlights how prey have evolved counter measures to bat echolocation to avoid detection and capture This includes the whole range of prey responses from being active at times when bats are inactive to the use of acoustic signals of their own to interfere with the echolocation system of bats

The Ecology of Predation at the Microscale Edouard Jurkevitch, Robert J. Mitchell, 2020-06-29 The book will provide an update on our understanding of predator-prey through the prism of ecology physiology molecular biology and mathematical modelling The integration of these different perspectives while focusing on the microbial realm will highlight the importance of scale in ecological interactions and their importance in applications This book should thereby contribute to theoretical as well as to applied ecologists and microbiologists Furthermore the detailed but amenable chapters could serve as the basis of teaching advanced courses in microbial ecology and environmental microbiology This work is a collection of articles that discuss microbial predation from a variety of perspectives It provides the readers a concise resource describing factors that are critical for several different predatory microbes including *Myxobacterium* spp and *Bdellovibrio* and like organisms BALOs including the mechanisms involved ecological conditions that adversely impact it and potential applications in aquaculture and bioproduction The first half of this collection focuses more on ecological aspects of predation with in depth discussions

on wolf pack predators the presence and activities of predators in waste water treatment plants and the role of intraguild predatory relationships i.e. when two different predators are competing for a single prey but also interact with one another. The reader will gain a deeper understanding of the predatory mechanisms involved and their ecological roles. In the latter half emphasis is given more to the application and limitations of predators. In addition to discussing secondary metabolite production within different microbial predators the readers will also learn how predators are being used to purify secondary metabolites from prey. This section also discusses the expanding and promising role of predation in aquaculture focusing on the application of predators to reduce pathogenic populations but includes some important caveats for young researchers to consider and follow when working with *Bdellovibrio*. This work is written for both experienced researchers already in the field and for young scientists who are captivated by the thought of predation at the microscale and its growing importance within a wide array of fields.

Predator-prey Interactions and Space Use Strategies for Two Mesocarnivores Abigail M. Weber, 2024. Mesocarnivores including bobcats *Lynx rufus* and coyotes *Canis latrans* serve an important ecological role functioning as the top predators throughout much of the eastern United States due to the extirpation of larger bodied carnivores. Mesocarnivores are often described as generalists due to their flexibility in forage and habitat preferences and their ability to persist in human dominated landscapes. However this characterization overlooks the fact that many individuals within these populations act as specialists with movement space use and predation strategies varying between individuals and across environmental contexts. Quantifying variability in mesocarnivore space use and movement from multiple perspectives can provide a better understanding of their ecological function as the current top predators and their potential influence on white tailed deer *Odocoileus virginianus* populations. To better understand how bobcats and coyotes spatially respond to fawn kill sites I leveraged two types of habitat selection functions Resource Selection Functions and Latent Selection Difference Functions to create a framework describing how bobcats coyotes and female white tailed deer respond to fawn kill sites and how these relationships vary with landscape heterogeneity. In certain landscape attributes does decreased their use of habitats which were associated with an increased risk of fawn predation. Additionally predators were more efficient at killing fawns in certain areas rather than increasing their selection for areas associated with increased fawn risk. To evaluate how space use strategies varied across individuals and environmental contexts I also quantified individual and population level variation in speed and resource specialization from coyotes located across three disparate environments forest agriculture and urban in Illinois. After accounting for the influence of various external and internal factors movement and space use behaviors varied substantially among coyotes within and across populations. Given that the integration of movement ecology and animal personality is relatively new my work served as a key first step in determining that behavioral patterns for movement and

habitat selection at one scale within a population do not necessarily hold across broader spatial scales across populations Overall I found that evaluating risk and space use from multiple perspectives can provide a deeper understanding of the predator prey spatial game and mesocarnivore space use *Quantifying Predator-prey Interactions* Pamela E. Moriarty,2018 Knowledge of predator prey interactions is vital in many subfields of ecology including food web ecology behavioral ecology and population ecology Information on predator prey interactions is obtained from a variety of sources including stomach contents biochemical tracers such as stable isotopes fecal matter and direct observation These data sources are used to infer the predator s diet and each presents analytical and interpretation challenges In this dissertation I pursue research to improve the analysis interpretation and application of varied data sources to study predator prey interactions My first chapter develops a mixture model to increase the accuracy and precision of diet estimates from stomach content data by addressing several challenges inherent to most stomach content datasets I extend this model in my second chapter to address sample interdependence which is a common issue due to sample collection methods My third chapter addresses the challenges of applying stable isotope analysis to jellyfish due to their unique physiology and proposes a path forward to be able to use this data source effectively My fourth chapter predicts the effect of hypoxia a common environmental stressor on energy flow from zooplankton to zooplanktivorous fish by merging multiple data sources in a Bayesian integrated assessment Together my dissertation research identifies and addresses some common challenges of analyzing predator prey interactions Library of Congress Subject Headings Library of Congress,2007 **Biodiversity and Insect Pests** Geoff M.
