Genetic Diversity Studies Tolerant Groundnut:

Genetic Diversity Studies In Drought Tolerant Groundnut Kunigeri Venkatesh, Thati Srinivas, Prasanna Rajesh, 2015-11-26 Groundnut is one of the most important oil and food crop of the world. However, it is considered to be an unpredictable legume mainly because of its cultivation in rainfed areas and constant efforts are being made to improve the crop productivity under rainfed conditions. In this direction, studies on genetic diversity correlation and path are expected to help the groundnut breeders in development of high yielding groundnut varieties for rainfed situation. In the present study, quantitative assessment of genetic divergence had resulted in grouping of the 50 rainfed and drought tolerant groundnut genotypes into nine clusters independent of geographical region and habit group. The genotypes K 1725, K 1719, K 1717, K 1718 and K 1848 were identified as promising genotypes for rainfed cultivation. Variability character associations and path studies revealed 100 kernel weight, pod and haulm yields to be effective selection criteria for kernel yield improvement in groundnut under rainfed conditions. The book is expected to aid the Groundnut crop breeders and also post graduate students of plant breeding discipline in their research projects on rainfed groundnut crop. *Gene Pool Diversity and Crop Improvement* Vijay Rani Rajpal, S. Rama Rao, S.N. Raina, 2016-02-02 The world population is estimated to reach more than 10 billion by the year 2050. These projections pose a challenging situation for the agricultural scientists to increase crop productivity to meet the growing food demands. The unavailability and/or inaccessibility to appropriate gene pools with desired traits required to carry out genetic improvement of various crop species make this task formidable for the plant breeders. Incidentally, most of the desired genes reside in the wild genetic relatives of the crop species. Therefore, exploration and characterization of wild genetic resources of important crop species is vital for the efficient utilization of these gene pools for sustainable genetic improvements to assure food security. Further understanding the myriad complexities of genic and genomic interactions among species, more particularly of wild relatives of crop species and/or phylogenetically distant germplasm, can provide the necessary inputs to increase the effectiveness of genetic improvement through traditional and/or genetic engineering methods. This book provides comprehensive and latest insights on the evolutionary genesis of diversity, access and its utilization in the evolution of various crop species. A comprehensive account of various crops, origin, exploitation of the primary, secondary and tertiary gene pools through breeding, biosystematical, cytogenetical and molecular phylogenetical relationships and genetic enhancement through biotechnological interventions among others have been provided as the necessary underpinnings to consolidate information on the effective and sustainable utilization of the related genetic resources. The book stresses upon the importance of wild germplasm exploration, characterization and exploitation in the assimilation of important crop species. The book is especially intended for students and scientists working on the genetic improvement of crop species. Plant Breeders, Geneticists, Taxonomists, Molecular Biologists and Plant Biotechnologists working on crop species are going to find this book very useful. **Genomic Designing for Abiotic Stress Resistant**

Oilseed Crops Chittaranjan Kole, 2022-04-05 This book presents deliberations on molecular and genomic mechanisms underlying the interactions of crop plants to the abiotic stresses caused by heat cold drought flooding submergence salinity acidity etc important to develop resistant crop varieties Knowledge on the advanced genetic and genomic crop improvement strategies including molecular breeding transgenics genomic assisted breeding and the recently emerging genome editing for developing resistant varieties in oilseed crops is imperative for addressing FHNEE food health nutrition energy and environment security Whole genome sequencing of these crops followed by genotyping by sequencing has provided precise information regarding the genes conferring resistance useful for gene discovery allele mining and shuttle breeding which in turn opened up the scope for designing crop genomes with resistance to abiotic stresses The eight chapters each dedicated to a oilseed crop in this volume elucidate on different types of abiotic stresses and their effects on and interaction with the crop enumerate on the available genetic diversity with regard to abiotic stress resistance among available cultivars illuminate on the potential gene pools for utilization in interspecific gene transfer present brief on classical genetics of stress resistance and traditional breeding for transferring them to their cultivated counterparts depict the success stories of genetic engineering for developing abiotic stress resistant crop varieties discuss on molecular mapping of genes and QTLs underlying stress resistance and their marker assisted introgression into elite varieties enunciate on different genomics aided techniques including genomic selection allele mining gene discovery and gene pyramiding for developing adaptive crop varieties with higher quantity and quality of yields and also elaborate some case studies on genome editing focusing on specific genes for generating abiotic stress resistant crops Orphan Crops: Breeding and Biotechnology for Sustainable Agriculture, Food and Nutrition Simon E. Bull, Jill Margaret Farrant, Rita Hogan Mumm, Zerihen Tadele, 2024-01-18 Orphan crops play an important role in food and nutrition security especially in growing economies where small holder farmers produce the majority of food Despite their importance in global agriculture and their often remarkable nutrient content and adaptation to challenging environmental conditions orphan crops have received limited attention by the scientific community and industry However the diversity of neglected plant species provides a large genetic resource that could significantly contribute to broadening the biodiversity of trait desired crops for novel value chains sustainable development and food security The uptake of new plant breeding techniques notably genome editing as well as omic tools are now accelerating translation of basic research and facilitating the exploration of orphan crops These advancements also give rise to public and politic engagement discussions to maximize socio economic impact Given that the greatest need for food and nutritional security is in growing economies issues of food sovereignty and sustainability of their food systems become front and centre There is now an exceptional opportunity to tackle some of the major current challenges in agriculture including climate change sustainable cropping systems food quality and nutritional security through broadening research in wild relatives of crops and on orphan species This Research Topic seeks to showcase research on neglected plants using advanced molecular

technologies e g genome sequencing omics etc and new plant breeding approaches methods and tools This Research Topic will also discuss the challenges and opportunities arising when modern breeding techniques are applied for translational research Neglected and Underutilized Crop Species for Sustainable Food and Nutritional Security: Prospects and Hidden Potential Omena Bernard Ojuederie,David Okeh Igwe,Ndomelele Ndiko Ludidi,Beckley Ikhajiagbe,2024-01-23 Global demand for food is rising as a result of increases in the global population as well as dietary changes Furthermore climate change exerts additional pressure on the food supply adversely affecting sustainable food production Increased temperatures and drought stresses coupled with the migration of pests limit crop yields and affect their nutritional quality Many staple crops are unable to adapt to these changing climatic conditions To achieve the Sustainable Development Goals of the United Nation to end hunger and promote good health and well being concerted efforts need to be made to enhance food production while mitigating the effects of climate change through the promotion of climate smart agricultural practices and the utilization of neglected and underutilized crop species These species can be highly nutritious and well adapted to different agroecologies and climatic conditions meaning that they offer the possibility of improving food and nutritional security **The Annual**
