

fused backups and to enable efficient updates by using replicate indexed structure of each primary.

## 2. OBJECTIVE

The main objective to introduce the fused backups to tolerate the faults occurred in distributed system, by using these fused backups which developer a system that reduces the fault recovery time. The maximum load can be distributed on any backups introducing this proposed system. Another motive to develop this proposed system is with space efficient and to reduce the updating time.

## 2.1 Scope

The main aim of the system developing is to reduce the overhead of replication. To tolerate ' $K$ ' crash faults among ' $n$ ' distinct data structures the technique of replication requires ' $K+1$ ' replicas of each data structure, which results ' $NK$ ' additional backups[8]. While using a fused data structure approach we use a fusion technique that uses a combination of erasure codes and some selective replication to tolerate ' $K$ ' crash faults using ' $K$ ' additional fused backups [3].

The fusion solution referred to use a combination of erasure codes and selective replicas to tolerate 'K' crash faults using 'K' additional fused backups [2]. The fusion solution saves  $O(n)$  space over replication.

### 3. IMPLEMENTATION

### 3.1 Architecture of Proposed System

**Fig. 1 = architecture of system**

The modules in the system contains

1. Formation of system
2. Primary data addition
3. Generation of fused data

4. Insertion of data
5. Deletion of data

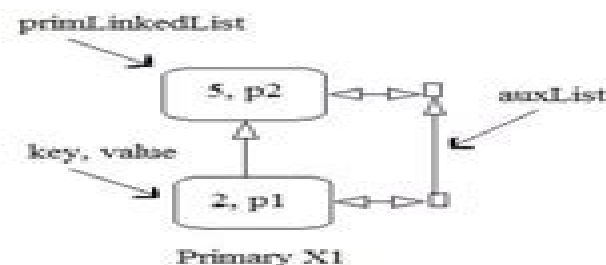

### Descriptions

### 3.1.1 Formation of system

The 'N' given data structures are referred to a primaries  $X_1, \dots, X_n$ .

The backup data structures are generated and referred as fixed backups or fixed data structures.

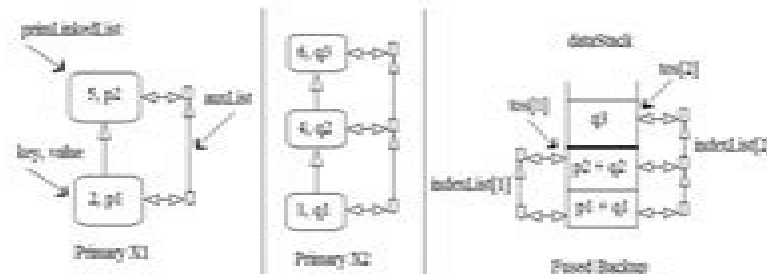

### 3.1.2 Primary Data Addition

**Fig 2: Primary data addition**

It is the module which is used to add the primary data to the server. It contains some key and value pairs. The figure shows the format of primary data addition.

### 3.1.3 Generation of Fused Data

**Fig. 3: Fused Data Generation**

The fused data is generated with respect to the primary data. The backup data structures are generated based on the process of fusing primary data known as fused backups or fused data structures. The operator who combines the primary data is called fusion operator.
