Fusion Of Biological Membranes And Related Problems Subcellular Biochemistry Volume 34:

Applications of Group-Theoretical Methods in Hydrodynamics V.K. Andreev, O.V. Kaptsov, Vladislav V.

Pukhnachev, A.A. Rodionov, 1998-10-31 It was long ago that group analysis of differential equations became a powerful tool for studying nonlinear equations and boundary value problems. This analysis was especially fruitful in application to the basic equations of mechanics and physics because the invariance principles are already involved in their derivation. It is in no way a coincidence that the equations of hydrodynamics served as the first object for applying the new ideas and methods of group analysis which were developed by I. V. Ovsyannikov and his school. The authors rank themselves as disciples of the school. The present monograph deals mainly with group theoretic classification of the equations of hydrodynamics in the presence of planar and rotational symmetry and also with construction of exact solutions and their physical interpretation. It is worth noting that the concept of exact solution to a differential equation is not defined rigorously; different authors understand it in different ways. The concept of exact solution expands along with the progress of mathematics: solutions in elementary functions, in quadratures, and in special functions; solutions in the form of convergent series with effectively computable terms; solutions whose searching reduces to integrating ordinary differential equations, etc. We consider it justifiable to enrich the set of exact solutions with rank one and rank two invariant and partially invariant solutions to the equations of hydrodynamics.

Biology of Inositols and Phosphoinositides A. Lahiri Majumder, B. B. Biswas, 2006-10-03 This volume describes the current status of the biology of inositols and phosphoinositides with an emphasis on the development in the area since the publication of volume 26 in 1996 in this series. The progress made in dissecting the genetics structure and evolution of the seminal enzyme for synthesis of inositol in the biological system has driven the understanding of the enzyme forward. With the current genomic and proteomic tools in place, the new role of inositols, inositol phosphates, and phosphoinositides in cell signaling or stress response has been explored. These advances are described in this volume and are expected to give new insights into the functional implications of inositol compounds across evolutionary diverse species.

Chromatin and Disease Tapas K. Kundu, Dipak Dasgupta, 2007-05-04 It is more evident now than ever before that dynamic organization of human genome into nucleoprotein structure, chromatin, confers the unique regulatory mechanisms for most of the cellular phenomena which include replication, transcription, DNA repair, recombination, and also apoptosis. The dynamic nature of the chromatin is regulated by chromatin modifications, epigenetic alterations, remodeling, histone chaperones, and functional interactions of different chromatin interacting histone proteins. Dysfunction of this highly interconnected machinery disturbs the cellular homeostasis and thereby causes several diseases. As we advance in our knowledge of chromatin function and also disease mechanisms in more details, their causal relationship is becoming more evident. This has led to the identification of chromatin function as a target for new generation therapeutics. In the light of these advances, it happens to be the right time to explore current insights into various aspects of chromatin and disease.

connection under one cover Authors who are actively involved in chromatin research and have made several original contributions to develop latest paradigms in the field have written the chapters of this book Significantly the authors repertoire is truly international They come from eight different countries of Asia Europe and America The book has been divided into three different parts Part I introduces the reader to the dynamic nature of chromatin structure and its link to diseases First two chapters in this part deal with the chromatin architecture chromatin dynamics in the cell cycle and molecular mechanism of chromatin remodeling

Peroxiredoxin Systems Leopold Flohé, J. Robin Harris, 2007-09-04 A volume within the Subcellular Biochemistry series is an appropriate setting for the first multi author book devoted to the new family of antioxidant and cell signalling proteins the peroxiredoxins Within the antioxidant and cell signalling fields even the existence of the peroxiredoxins has yet to be appreciated by many with this book we aim to rectify this situation We have tried to select diverse chapter topics to cover relevant aspects of the subject and to persuade knowledgeable authors to contribute a manuscript As almost inevitable a few authors let us down by failing to respond others could not submit a manuscript in time for personal reasons These unfortunately were two of the pioneers Earl Stadtman and Sue Goo Rhee but we appreciate that they communicated a lot of details that helped us to reconstruct the early phase of peroxiredoxin enzymology We have thus compiled a book that competently covers the peroxiredoxin field from its beginnings through to currently relevant topics In the introductory Chapter 1 we provide a short historical survey of the subject based upon the early structural and enzymic studies on peroxiredoxins and then lead into some of our current personal interests such as the likely continuing contribution of transmission electron microscopy TEM for the study of high molecular mass peroxiredoxin complexes and the association of peroxiredoxins with other proteins and the targeting of drugs against microbial peroxiredoxins as future therapeutic approaches

Phospholipid Metabolism in Apoptosis Peter J. Quinn, Valerian E. Kagan, 2006-04-18 The last few years have witnessed an explosion of both interest and knowledge about apoptosis the process by which a cell actively commits suicide The number of publications on the topic has increased from nothing in the early 1980s to more than 10 000 papers annually today It is now well recognized that apoptosis is essential in many aspects of normal development and is required for maintaining tissue homeostasis The idea that life requires death seems somewhat paradoxical but cell suicide is essential for an animal to survive For example without selective destruction of non self T cells an animal would lack immunity Similarly meaningful neural connections in the brain are whittled from a mass of cells Further developmental cell remodeling during tissue maturation involves programmed cell death as the major mechanism for functional and structural safe transition of undifferentiated cells to more specialized counterparts Apoptosis research with roots in biochemistry developmental and cell biology genetics and immunology embraces this long ignored natural law Failure to properly regulate apoptosis can have catastrophic consequences Cancer and many diseases AIDS Alzheimer s disease Parkinson s disease heart attack stroke etc are thought to arise from deregulation of apoptosis As apoptosis emerges

as a key biological regulatory mechanism it has become harder and harder to keep up with new developments in this field

Fusion of Biological Membranes and Related Problems Herwig J. Membrane Dynamics and Domains Peter J. Quinn, 2013-06-29 The fluid mosaic model of membrane structure formulated by Singer and Nicolson in the early 1970s has proven to be a durable concept in terms of the principles governing the organization of the constituent lipids and proteins During the past 30 or so years a great deal of information has accumulated on the composition of various cell membranes and how this is related to the different functions that membranes perform Nevertheless the task of explaining particular functions at the molecular level has been hampered by lack of structural detail at the atomic level The reason for this is primarily the difficulty of crystallizing membrane proteins which require strategies that differ from those used to crystallize soluble proteins The unique exception is bacteriorhodopsin of the purple membrane of *Halobacterium halobium* which is interpolated into a membrane that is neither fluid nor in a mosaic configuration To date only 50 or so membrane proteins have been characterised to atomic resolution by diffraction methods in contrast to the vast data accumulated on soluble proteins Another factor that has been difficult to explain is the reason why the lipid complement of membranes is often extremely complex Many hundreds of different molecular species of lipid can be identified in some membranes Remarkably the particular composition of each membrane appears to be maintained within relatively narrow limits and its identity distinguished from other morphologically distinct membranes

Cell Fusion A.E. Sowers, 2013-11-11 Over the last decade the volume *Membrane Fusion* edited by Poste and Nicholson has probably served as one of the major sources of review information on fusion in membrane systems Since its publication much new information has been collected New methods of inducing fusion have been invented or discovered and new applications for fusion have been found The need for an up to date monograph that covers and integrates these subjects reviews established material and rationalizes and integrates the old and the new is thus obvious This book is the product of efforts to meet this need Most of the current work

in the field of membrane fusion takes place within the context of intact or modified cells Hence this book emphasizes the plasma membrane Each chapter is either a review a report or a short historical overview depending respectively on whether the subject is large in scope and has a long history or the subject is in such an early stage of development that most of what is known is still in the hands of a relatively small number of investigators and is best covered in report form *Biological Membranes: Structure, Biogenesis and Dynamics* Jos A.F. Op den Kamp, 2013-06-29 The Advanced Study Institute on Structure Biogenesis and Dynamics of Biological Membranes held in Cargese from June 14-26 1993 has been dealing with four major topics in membrane biochemistry today lipid dynamics and lipid protein interactions protein translocation and insertion intracellular traffic and protein structure and folding The lecturers discussed these topics starting from several disciplines including biochemistry cell biology genetics and biophysics This way an interdisciplinary and very interesting view on biological membrane systems was obtained At first an extensive overview of mainly biophysical techniques which can be used to study dynamic processes in membranes was presented Sophisticated approaches such as ESR and NMR have been applied successfully to unravel details of specific lipid protein interactions x ray analysis provides detailed structural information of several proteins and the possible implications for protein functions Information obtained this way is complemented by studies on mechanisms and kinetics of protein folding The latter information is indispensable when discussing protein translocation and insertion processes in which folding and unfolding play essential roles Extensive insight was offered in the complicated machinery of phospholipid biosynthesis In particular the application of sophisticated genetic techniques has allowed a better understanding of the mechanisms regulating the synthetic machinery and detailed studies on a variety of mutants lacking one or more of the essential enzymes have resulted in the beginning of a bL
