students approaching this intriguing field for the first time Thorough survey of the field of neural development Concise but complete suitable for a one semester course on upper level undergraduate or graduate level Focus on fundamental principles of organogenesis in the nervous system Integrates information from a variety of model systems relating them to human nervous system development including disorders of development Systematically develops knowledge from the description of key experiments and results Organized ontologically Carefully edited to be presented in one voice New edition thoroughly updated and revised to include major new findings All figures in full color updated and revised Specific attention on revising the chapter on cognitive and behavioral development to provide a foundation and outlook towards those very fast moving areas Instructor website with figure bank and test questions

Neuroscience Ray Arters, The nervous system represents the most complex and sophisticated information processing network known to science consisting of billions of interconnected neurons that collectively enable perception cognition emotion and behavior This remarkable biological computer emerges from the coordinated activity of individual nerve cells that communicate through electrical and chemical signals creating emergent properties that give rise to consciousness memory and the full spectrum of human experience Neurons serve as the fundamental functional units of the nervous system specialized cells that have evolved unique structural and biochemical properties to excel at rapid long distance communication The typical neuron exhibits a polarized morphology with distinct regions including the cell body or soma that contains the nucleus and most organelles dendrites that receive signals from other neurons and an axon that transmits signals to target cells This architectural specialization enables neurons to integrate multiple inputs and generate appropriate outputs with remarkable precision and speed The cell membrane of neurons exhibits specialized properties that enable the generation and propagation of electrical signals through the selective permeability to different ions particularly sodium potassium calcium and chloride The resting potential of approximately 70 millivolts reflects the unequal distribution of these ions across the membrane maintained by energy dependent pumps and selective ion channels that create the electrochemical gradients essential for neural signaling
