

## PRINCIPLES OF TOOTH PREPARATION

Many of the principles of tooth preparation apply equally to the preparation of endodontically treated teeth, although certain additional concepts must be understood to avoid failure.

Fig. 3-1: A, It is preferable to maintain as much coronal tooth structure as possible, provided it is sound and of reasonable strength. B, Extensive caries has resulted in the loss of all coronal tooth structure. This is less desirable than the situation in A, because greater forces are transmitted to the root.

In a maxillary central incisor prepared for a post-and-core, six features of successful design are identified (Fig. 3-2):

1. Adequate apical seal.
2. Minimum canal enlargement (no undercuts remaining).
3. Adequate post length.
4. Positive horizontal stop (to minimize wedging).
5. Vertical wall to prevent rotation (similar to a box).
6. Extension of the final restoration margin onto sound tooth structure.

Fig. 3-3: Use of a prefabricated post entails enlarging the canal one or two file sizes to obtain a good fit at a predetermined depth.  
A, Incorrect; the prefabricated post is too narrow.  
B, Incorrect; the prefabricated post does not extend to the apical seal.  
C, Correct; the prefabricated post is fitted by enlarging the canal slightly.

Fig. 3-4: Extending a preparation apically creates a ferrule and helps prevent fracture of an endodontically treated tooth during function.  
A, Prepared with a ferrule (arrows)  
B, Prepared without a ferrule.
