Einsiedler,Thomas Ward,2020-10-03 This book takes the reader on a journey from familiar high school mathematics to  
undergraduate algebra and number theory The journey starts with the basic idea that new number systems arise from  
solving different equations leading to abstract algebra Along this journey the reader will be exposed to important ideas of  
mathematics and will learn a little about how mathematics is really done Starting at an elementary level the book gradually  
eases the reader into the complexities of higher mathematics in particular the formal structure of mathematical writing  
definitions theorems and proofs is introduced in simple terms The book covers a range of topics from the very foundations  
numbers set theory to basic abstract algebra groups rings fields driven throughout by the need to understand concrete  
equations and problems such as determining which numbers are sums of squares Some topics usually reserved for a more  
advanced audience such as Eisenstein integers or quadratic reciprocity are lucidly presented in an accessible way The book  
also introduces the reader to open source software for computations to enhance understanding of the material and nurture  
basic programming skills For the more adventurous a number of Outlooks included in the text offer a glimpse of possible  
mathematical excursions This book supports readers in transition from high school to university mathematics and will also  
benefit university students keen to explore the beginnings of algebraic number theory It can be read either on its own or as a  
supporting text for first courses in algebra or number theory and can also be used for a topics course on Diophantine

Integer Nonlinear Programming** Ivo Nowak,2006-03-28

Nonlinear optimization problems containing both continuous and discrete variables are called mixed integer nonlinear programs  
MINLP Such problems arise in many fields such as process industry engineering design communications and finance There is  
currently a huge gap between MINLP and mixed integer linear programming MIP solving technology With a modern state of  
the art MIP solver it is possible to solve models with millions of variables and constraints whereas the  
dimension of solvable MINLP is often limited by a number that is smaller by three or four orders of magnitude It is theoretically  
possible to approximate a general MINLP by a MIP with arbitrary precision However good MIP approximations are usually  
much larger than the original problem Moreover the approximation of nonlinear functions by piecewise linear functions can

be difficult and time consuming In this book relaxation and decomposition methods for solving nonconvex structured MINLPs are proposed In particular a generic branch cut and price BCP framework for MINLP is presented BCP is the underlying concept in almost all modern MIP solvers Providing a powerful decomposition framework for both sequential and parallel solvers it made the success of the current MIP technology possible So far generic BCP frameworks have been developed only for MIP for example COIN BCP IBM 2003 and ABACUS OREAS GmbH 1999 In order to generalize MIP BCP to MINLP BCP the following points have to be taken into account A given sparse MINLP is reformulated as a block separable program with linear coupling constraints The block structure makes it possible to generate Lagrangian cuts and to apply Lagrangian heuristics In order to facilitate the generation of polyhedral relaxations nonlinear convex relaxations are constructed The MINLP separation and pricing subproblems for generating cuts and columns are solved with specialized MINLP solvers
