Convergent Evolution on Earth George R. McGhee, Jr., 2019-10-29 An analysis of patterns of convergent evolution on Earth that suggests where we might look for similar convergent forms on other planets Why does a sea lily look like a palm tree And why is a sea lily called a lily when it is a marine animal and not a plant Many marine animals bear a noticeable similarity in form to land dwelling plants And yet these marine animal forms evolved in the oceans first land plants independently and convergently evolved similar forms much later in geologic time In this book George McGhee analyzes patterns of convergent evolution on Earth and argues that these patterns offer lessons for the search for life elsewhere in the

universe Our Earth is a water world 71 percent of the earth's surface is covered by water The fossil record shows that multicellular life on dry land is a new phenomenon for the vast majority of the earth's history 3 500 million years of its 4 560 million years of existence complex life existed only in the oceans Explaining that convergent biological evolution occurs because of limited evolutionary pathways McGhee examines examples of convergent evolution in forms of feeding immobility and mobility defense and organ systems McGhee suggests that the patterns of convergent evolution that we see in our own water world indicate the potential for similar convergent forms in other water worlds We should search for extraterrestrial life on water worlds and for technological life on water worlds with continental landmasses

Molecular Genetics of Axial Patterning, Growth and Disease in Drosophila Eye Amit Singh, Madhuri Kango-Singh, 2020-05-18 Drosophila melanogaster fruit fly is a highly versatile model with a genetic legacy of more than a century It provides powerful genetic cellular biochemical and molecular biology tools to address many questions extending from basic biology to human diseases One of the most important questions in biology is how a multi cellular organism develops from a single celled embryo The discovery of the genes responsible for pattern formation has helped refine this question and has led to other questions such as the role of various genetic and cell biological pathways in regulating the process of pattern formation and growth during organogenesis The Drosophila eye model has been extensively used to study molecular genetic mechanisms involved in patterning and growth Since the genetic machinery involved in the Drosophila eye is similar to humans it has been used to model human diseases and homology to eyes in other taxa This updated second edition covers current progress in the study of molecular genetic mechanisms of pattern formation mutations in axial patterning genetic regulation of growth and more using the Drosophila eye as a model
