

Imagine an agent in the city of Arad, Romania, enjoying a vacation holiday. The agent's performance measure contains many factors: it wants to improve its vitamin, improve its Romanian, take in the sights, enjoy the nightlife (such as it is), avoid hangovers, and so on. The decision problem is a complex one involving many tradeoffs and careful reading of guidebooks. Now, suppose the agent decides to fly out of Bucharest the following day. In that case, the agent's performance measure is affected. Courses of action are evaluated in terms of their expected utility, and the agent's performance is affected without further consideration. Goals help organize behavior and hence the actions it needs to take, and the agent's performance is affected.

We will consider the goal of getting to Bucharest. The goal is satisfied if the agent reaches a goal state (or a state that is a goal state) what is the level of "need" for the goal? The agent would like to reach the goal because at that point it would have reached too many steps and states to consider. We assume that the agent is in a state where it is considering where to go next, one to Timisoara, and one
