Dynamic Nuclear Magnetic Resonance Spectroscopy:

Dynamic Nuclear Magnetic Resonance Spectroscopy Lloyd Jackman, 2012-12-02 Dynamic Nuclear Magnetic Resonance Spectroscopy provides an overview of the state of knowledge in dynamic nuclear magnetic resonance DNMR spectroscopy The early chapters describe the theoretical basis and practical techniques which have or will be used for extracting kinetic data from DNMR spectra The subsequent chapters provide reviews of the many areas in which DNMR spectroscopy has been applied Key topics covered include nuclear exchange processes band shape analysis application of nonselective pulsed NMR experiments diffusion and chemical exchange spin spin relaxation time determination rotation about single and double bonds in organic molecules and dynamic molecular processes in inorganic and organometallic compounds Also discussed are studies on stereochemical nonrigidity in organometallic and metal carbonyl compounds fluxional allyl complexes carbonium ion rearrangements and proton transfer processes It is hoped that this volume will provide a literature guide source book and progress report which will be helpful to all those who will continue or will begin work in this field **Dynamic Nuclear Magnetic Resonance Spectroscopy** Lloyd M. Dynamic NMR Spectroscopy, 2012-12-06 Since the first successful NMR experiments in 1946 it was well appreciated that dynamic processes play an important role in the NMR spectroscopy of bulk matter 1 Early theories on the dependence of the relaxation parameters T_1 and T_2 on the motions of nuclear spins were successful in explaining the dipolar broadening of the NMR signal in solids and the motional narrowing in liquids 2 With the discovery of chemical shifts and spin spin couplings another type of dynamical process affecting the NMR line shape became apparent the chemical exchange As a consequence dynamical NMR studies split into two groups differing not only in the dynamical topics but also in the method of investigation physical studies of the motion of spins in liquids and solids by measurement of the relaxation times of single resonances and on the other hand chemical studies based on band shape analysis of NMR spectra recorded under steady state conditions The two fields of research lost some of their basic differences with the development of the Fourier transform NMR method 3 which allows the measurement of relaxation times of different resonances at the same time i.e. the study of differential motional behavior of different parts of molecules thus providing a new tool in conformational analyses For example information can be obtained by this method on the relative importance of overall motions and internal motions 4 **DYNAMIC NUCLEAR MAGNETIC RESONANCE SPECTROSCOPY**.
