Central Nervous System Tissue Engineering Ashley E. Wilkinson, Aleesha M.

McCormick, Nic D. Leipzig, 2022-06-01 Combating neural degeneration from injury or disease is extremely difficult in the brain and spinal cord i e central nervous system CNS Unlike the peripheral nerves CNS neurons are bombarded by physical and chemical restrictions that prevent proper healing and restoration of function The CNS is vital to bodily function and loss of any part of it can severely and permanently alter a person s quality of life Tissue engineering could offer much needed solutions to regenerate or replace damaged CNS tissue This review will discuss current CNS tissue engineering approaches integrating scaffolds cells and stimulation techniques Hydrogels are commonly used CNS tissue engineering scaffolds to stimulate and enhance regeneration but fiber meshes and other porous structures show specific utility depending on application CNS relevant cell sources have focused on implantation of exogenous cells or stimulation of endogenous populations Somatic cells of the CNS are rarely utilized for tissue engineering however glial cells of the peripheral nervous system PNS may be used to myelinate and protect spinal cord damage Pluripotent and multipotent stem cells offer alternative cell sources due to continuing advancements in identification and differentiation of these cells Finally physical chemical and electrical guidance cues are extremely important to neural cells serving important roles in development and adulthood These guidance cues are being integrated into tissue engineering approaches Of particular interest is the inclusion of cues to guide stem cells to differentiate into CNS cell types as well to guide neuron targeting This review should provide the reader with a broad understanding of CNS tissue engineering challenges and tactics with the goal of fostering the future development of biologically inspired designs Table of Contents Introduction Anatomy of the CNS and Progression of Neurological Damage Biomaterials for Scaffold Preparation Cell Sources for CNS TE Stimulation and Guidance Concluding Remarks

intervertebral disc IVD are common causes of morbidity and of severe life quality deterioration IVD degeneration although in many cases asymptomatic is often the origin of painful neck and back diseases In Western societies IVD related pain and disability account for enormous health care costs as a result of work absenteeism and thus lost production disability benefits medical and insurance expenses Although only a small percentage of patients with disc disorders finally will undergo surgery spinal surgery has been one of the fastest growing disciplines in the musculoskeletal field in recent years Nevertheless current treatment options are still a matter of controversial discussion In particular they hardly can restore normal spine biomechanics and prevent degeneration of adjacent tissues While degeneration affects all areas of the IVD the most constant and noticeable changes occur in the gel like central part the nucleus pulposus NP Recent emphasis has therefore been put in biological ways to regenerate the NP however there are a number of obstacles to overcome considering the exceptional biological and biomechanical environment of this tissue Different biological approaches such as molecular gene and cell based therapies have been investigated and have shown promising results in both in vitro and in vivo studies Nonetheless considerable hurdles still exist in their application for IVD regeneration in human patients The choice of the cells and the choice of the cell carrier suitable for implantation pose major challenges for research and development activities This lecture recapitulates the basics of IVD structure function and degeneration mechanisms The first part reviews the recent progress in the field of disc and stem cell based regenerative approaches In the second part most appropriate biomaterials that have been evaluated as cell or molecule carrier to cope with degenerative disc disease are outlined The potential and limitations of cell and biomaterial based treatment strategies and perspectives for future clinical applications are discussed
