Explanatory Item

Response Models Paul de Boeck,Mark Wilson,2013-03-09 This edited volume gives a new and integrated introduction to item response models predominantly used in measurement applications in psychology education and other social science areas from the viewpoint of the statistical theory of generalized linear and nonlinear mixed models Moreover this new framework allows the domain of item response models to be coordinated and broadened to emphasize their explanatory uses beyond their standard descriptive uses The basic explanatory principle is that item responses can be modeled as a function of predictors of various kinds The predictors can be characteristics of items of persons and of combinations of persons and items they can be observed or latent of either items or persons and they can be latent continuous or latent categorical Thus a broad range of models can be generated including a wide range of extant item response models as well as some new ones Within this range models with explanatory predictors are given special attention but we also discuss descriptive models Note that the item responses that we are referring to are not just the traditional test data but are broadly conceived as categorical data from a repeated observations design Hence data from studies with repeated observations

experimental designs or with longitudinal designs may also be modeled The intended audience for this volume is rather broad
