## **Dynamics Of Saturated Electric Machines:**

Dynamics of Saturated Electric Machines Vlado Ostovic, 2012-12-06 This book is a result of the author's work which was initiated about a decade ago and which in the meantime has resulted in his Ph D Thesis and several technical papers. The book deals with accurate modeling of electric machines during transient and steady states, a topic which has been usually avoided in the literature. The modeling techniques herein take into account all machine peculiarities such as the type and connection of its windings, slotting and saturation in the iron core. A special emphasis in the book is given to the exact physical interpretation of all phenomena which influence the machine's transient behavior. Besides the Introduction, the book has five chapters. The second chapter describes basic concepts of the magnetic equivalent circuit theory and has examples of magnetic equivalent circuits of several types of machines with their node potential equations. In the third chapter, the transform matrices  $w$  and  $w$  of AC windings are derived. These matrices play a very important role in the magnetic equivalent circuit theory because they connect the quantities from the machine's magnetic equivalent circuit branch fluxes and mmfs with the machine's phase currents and fluxes.

Dynamics of Saturated Electric Machines Vlado Ostović, 1989-01-01      **Linear Electric Machines, Drives, and MAGLEVs Handbook** Ion Boldea, 2023-07-31 Linear motion is richly present in various industries from direct electric propulsion in urban and interurban people movers on wheels or on magnetic cushions, MAGLEVs to indoor transport of goods, conveyors etc. through plunger solenoids to open hotel doors and as electromagnetic power switches to compressor drives by linear oscillatory permanent magnet PM motors, smart phones, integrated microphone and loudspeakers and controlled vehicles suspension etc. Besides the traditional rotary motor drives with mechanical transmissions which mean friction limitations, weather dependent in traction, heavy vehicles, more losses, positioning errors, backlash in the process and higher maintenance costs to handle them, linear motion in industry by direct electromagnetic forces is free of friction limitations for traction, free of mechanical transmission and thus more efficient with less maintenance cost and fewer positioning errors, backlash. This explains why they are used in so many applications already since the dramatic advancement of power electronics and digital control in the last four decades. Modeling, performance, design, control and testing of linear electric machines (LEMs) show notable differences with respect to rotary electric motor drives which warrant a dedicated treatment of these aspects. The Second Edition, First Edition 2013 concentrates on the above technical aspects of various types of LEMs in close relationship with specific applications via numerical examples of modeling, design, control and testing with ample representative results from literature, industry and some of the author's contributions such as: Technical field and circuit modeling of linear induction motors in flat configurations for low and high speeds with and without dynamic end effects and in tubular configurations, short travel, design, control and testing, Linear synchronous motor (LSM) drives in dc excited homopolar reluctance and superconducting excitation configurations for urban and interurban high speed vehicles propulsion and integrated propulsion and levitation in

MAGLEVs modeling design and control with full scale numerical examples with emphasis on lower KWh passenger Km at high speeds Flat and tubular linear permanent magnet PM synchronous motors L PMSMs mainly destined to industrial indoor transport for automation at high efficiency in clean rooms Linear flux modulation motors new breed suitable for very low speed applications due to higher thrust density Plunger solenoids in various applications including new valve PM actuators with millisecond response time Linear resonant PM oscillatory motors design control and testing mainly destined to compressors for higher efficiency in compact drives Attraction and repulsive force suspension levitation systems for MAGLEVs Active and passive guideway MAGLEVs in urban and superhigh speed interurban transport at lower Kwh per passenger km in lighter vehicles without wheels The numerous numerical design and control examples with practical specifications throughout the 23 chapters of the book allow the reader deep and fast access to a practical but thorough unitary good for comparisons methodology in designing and controlling LEMs for various applications
